

libhpdfbtbl

Generated on Wed May 4 2022 00:18:22 for libhpdfbtbl by Doxygen 1.9.3

Wed May 4 2022 00:18:22

1 Introduction to hpdftbl	1
1.1 What is this?	1
1.2 Features	1
1.3 Some Examples	2
1.3.1 Example 1 - Plain table with cell labels	2
1.3.2 Example 2 - Table with cell labels	2
1.3.3 Example 2 - Plain table with row/column spanning and table title	2
1.3.4 Example 3 - Table with labels and cell widgets	3
2 Building the library	5
2.1 The short version	5
2.1.1 Compiling the tar ball	5
2.2 Pre-requisites	5
2.2.1 Different versions of iconv on OSX	6
2.2.2 OSX native libiconv	6
2.2.3 OSX GNU port of libiconv	6
2.2.4 Troubleshooting OSX <code><tt>libiconv</tt></code>	6
2.3 Building the library from source	7
2.3.1 Rebuilding using an existing build environment	7
2.3.2 Rebuilding from a cloned repo	7
2.4 Miscellaneous	8
2.4.1 Some notes on Compiling for debugging	8
2.4.2 Some notes on updating the documentation	8
2.4.3 Some notes on Windows build	9
2.4.4 Some notes on using C or C++ to build	9
3 Getting started	11
3.1 Creating a PDF page infrastructure	11
3.2 Your first table	12
3.3 Your second table - disconnecting program structure from data	14
3.4 Adding a header row	15
3.5 Using labels in the table cells	15
3.6 Adding a table title	16
3.7 Adjusting fonts and colors	17
4 Adjusting the layout of the table	19
4.1 Cell and row spanning	19
4.2 Adjusting column width	19
5 Content and label callbacks	21
5.1 Introducing content callback functions	21
5.2 A content callback example	22
6 Error handling	25

6.1 Translating HPDF error codes	26
6.2 Example of setting up error handler	26
7 Style and font setting	27
7.1 Adjusting fonts and colors	27
7.2 Using style callbacks	28
7.2.1 Style callback example	29
7.3 Using style themes	30
7.4 Adjusting grid line styles	31
8 Tables layout from data	33
8.1 Defining a table in data	33
8.2 A first example of defining table as data	34
8.3 A second example of defining a table as data	34
9 Widgets	37
9.1 Overview	37
9.1.1 1. Segmented horizontal bar example	37
9.1.2 2. Horizontal bar example	37
9.1.3 3. Signal strength meter example	37
9.1.4 4. Radio sliding button example	38
9.1.5 5. Boxed letters example	38
9.2 Widget functions	38
9.2.1 Segmented horizontal bar defining function	38
9.2.2 Horizontal bar defining function	38
9.2.3 Signal strength defining function	39
9.2.4 Radio sliding button defining function	39
9.2.5 Boxed letters defining function	39
9.3 Usage	39
10 HPDFTBL API Overview	41
10.1 Table creation related functions	41
10.2 Table error handling	41
10.3 Theme handling methods	41
10.4 Table layout adjusting functions	42
10.5 Table style modifying functions	42
10.6 Content handling	43
10.7 Callback handling	43
10.8 Text encoding	43
10.9 Misc utility function	43
11 Todo List	45
12 Data Structure Index	47

12.1 Data Structures	47
13 File Index	49
13.1 File List	49
14 Data Structure Documentation	51
14.1 grid_style Struct Reference	51
14.1.1 Detailed Description	51
14.1.2 Field Documentation	51
14.1.2.1 color	51
14.1.2.2 line_dashstyle	52
14.1.2.3 width	52
14.2 hpdftbl Struct Reference	52
14.2.1 Detailed Description	53
14.2.2 Field Documentation	53
14.2.2.1 bottom_vmargin_factor	53
14.2.2.2 canvas_cb	53
14.2.2.3 cells	54
14.2.2.4 col_width_percent	54
14.2.2.5 cols	54
14.2.2.6 content_cb	54
14.2.2.7 content_style	54
14.2.2.8 content_style_cb	55
14.2.2.9 header_style	55
14.2.2.10 height	55
14.2.2.11 inner_hgrid	55
14.2.2.12 inner_tgrid	55
14.2.2.13 inner_vgrid	56
14.2.2.14 label_cb	56
14.2.2.15 label_style	56
14.2.2.16 minheight	56
14.2.2.17 outer_grid	56
14.2.2.18 pdf_doc	57
14.2.2.19 pdf_page	57
14.2.2.20 posx	57
14.2.2.21 posy	57
14.2.2.22 rows	57
14.2.2.23 tag	57
14.2.2.24 title_style	58
14.2.2.25 title_txt	58
14.2.2.26 use_cell_labels	58
14.2.2.27 use_header_row	58
14.2.2.28 use_label_grid_style	58

14.2.2.29 use_zebra	59
14.2.2.30 width	59
14.2.2.31 zebra1_color	59
14.2.2.32 zebra2_color	59
14.3 hpdfbtbl_cell Struct Reference	59
14.3.1 Detailed Description	60
14.3.2 Field Documentation	60
14.3.2.1 canvas_cb	60
14.3.2.2 colspan	60
14.3.2.3 content	61
14.3.2.4 content_cb	61
14.3.2.5 content_style	61
14.3.2.6 delta_x	61
14.3.2.7 delta_y	61
14.3.2.8 height	61
14.3.2.9 label	61
14.3.2.10 label_cb	62
14.3.2.11 parent_cell	62
14.3.2.12 rowspan	62
14.3.2.13 style_cb	62
14.3.2.14 textwidth	62
14.3.2.15 width	62
14.4 hpdfbtbl_cell_spec Struct Reference	63
14.4.1 Detailed Description	63
14.4.2 Field Documentation	63
14.4.2.1 canvas_cb	63
14.4.2.2 col	64
14.4.2.3 colspan	64
14.4.2.4 content_cb	64

Chapter 1

Introduction to hpdftbl

1.1 What is this?

The Haru PDF library is a great way to programmatically produce PDFs from programs. However, in many instances the best way to present data produced is as a grid (or table). To manually create and setup such tables in the Haru PDF library is of course possible but only painstakingly so.

This C/C++ library `libhpdftbl` will facilitate the creation of tables with the Haru PDF library as well as handling the pesky issue of character conversion needed between UTF-8 and the internal standard used by PDF and Lib Haru. In addition to mere normal table the library also supports the creation of forms where each cell has a label similar to "formal" paper forms. This is a great way to present structured data from a DB.

This library provides a flexible abstraction for creating advanced tables with a model-view-controller like setup. This allows an easy way to separate the layout of the table from the actual data in the table.

1.2 Features

- Supports both C/C++
- Supports both OSX/Linux builds and their different dynamic library variants
- Fully supports UTF-8 with automatic conversion to PDF character encoding
- Supports multiple paradigms for creating and populating tables
 - Directly store value in table cell
 - Create a data structure (2D-Array) with all data to be set at once
 - Use callback populating functions with identifying tags for each table cell
- Options to use labels in table cell to create forms
- Support for predefined widgets in table cell to illustrate values
- Complete control of background color, fonts, and frame colors
- Possible to use table themes that provides pre-defined look-and-feel for table
- Both dynamic and static library provided
- Last but not least; extensive documentation and almost guaranteed to be bug free after being tested in production for over 7 years!

1.3 Some Examples

Note

All code examples can be found in the "`examples/`" directory and are thoroughly introduced over the following chapters.

1.3.1 Example 1 - Plain table with cell labels

[tut_ex02_1.c](#)

Header 0	Header 1	Header 2	Header 3
Content 4	Content 5	Content 6	Content 7
Content 8	Content 9	Content 10	Content 11
Content 12	Content 13	Content 14	Content 15

1.3.2 Example 2 - Table with cell labels

Chapter 2

Building the library

2.1 The short version

2.1.1 Compiling the tar ball

If you downloaded the tar-ball then it should be trivial to build and install if you have the necessary pre-requisites. Just download the tar-ball and do the standard spell:

```
$ tar xzf libhpdf-1.0.0.tar.gz
$ cd libhpdf-1.0.0
$ ./configure && make
$ make install
```

If you miss any library the `configure` process will discover this and tell you what you need to install. This would otherwise compile and install the library in `/usr/local` subtree. It will build and install both a static and dynamic library.

Note

By calling `./configure -h` a list of possible options on how the library should be compiled and installed will be shown.

Depending on your system this might also be available as a pre-built package for you to install directly via perhaps `apt` on Linux or `brew` on OSX.

2.2 Pre-requisites

Note

OSX Package manager: We recommend using `brew` as the package manager for OSX.

There are two external libraries required to rebuild libhpdf and more importantly use the library with an actual application and these are:

1. **libhpdf** - The Haru PDF library. On OSX this is most easily installed by using the `brew` OSX package manager. The library is available as `libharu` as of this writing the latest version is `libharu-2.3.0`
2. **iconv** - The character encoding conversion library. On OSX > 11.x this is included by default once you have `xcode` command line tools installed which is basically a pre-requisite required for all development on OSX. *(On really old versions of OSX this was not the case.)*

2.2.1 Different versions of iconv on OSX

Unfortunately there are two main versions of `libiconv` readily available for OSX which are incompatible as one uses the prefix `"iconv_"` and the other `"libiconv_"` on its exported functions. Compiling `libhpdf.tbl` requires the first of these which is the prevalent version and the default on both OSX and Linux.

This is almost exclusively an issue for those that actively develop on OSX and may have over time installed multiple versions of libraries and as such are aware of these challenges.

2.2.2 OSX native libiconv

After installing `xcode` command line tools on OSX you can assume that a library called `/usr/lib/iconv.dylib` is available. However, if you actually try to list this library in `/usr/lib` you will not find it! Still, if you link your code with `-liconv` it will work as expected. How come?

The reason is the way OSX handles different library versions for different OSX SDKs. Since `xcode` supports developing for different OSX versions the SDK would need to include a complete setup of all `*.dylib` of the right version for each included version of the SDK. To reduce disk space all dynamic libraries are rolled-up in a dynamic link shared cache for each SDK version. The tool chain (e.g. `gcc`) have been augmented to be aware of this. Hence there is no need to have libraries in `/usr/lib`. Instead OSX from v11 and onwards uses the concept of *stub libraries* `*.tbd` (`tbd` stands for "text based description") which are much smaller text files with some meta information about the library used by the tool-chain.

For example for SDK 12.3 the stub for `libiconv` can be found at
`/Library/Developer/CommandLineTools/SDKs/MacOSX12.3.sdk/usr/lib/libiconv.tbd`

and the corresponding include header at
`/Library/Developer/CommandLineTools/SDKs/MacOSX12.3.sdk/usr/include/iconv.h`

2.2.3 OSX GNU port of libiconv

If you have happened to install `libiconv` via the MacPorts you are out of luck and need to change. MacPorts uses the GNU version which uses the prefix `"libiconv_"` for its exported function and is not compatible since the table library assumes the naming convention of the standard OSX version (after v11)

2.2.4 Troubleshooting OSX `libiconv`

1. Find out all installed versions of `libiconv` on your installation

```
$> find / -iregex '.*libiconv.*' 2> /dev/null
```

The `"2> /dev/null"` makes sure you don't get a lot of noise "permission denied"

2. Find out the SDK path that is actively used

```
$> xcrun --show-sdk-path
```

3. Check you `PATH` variable

```
$> echo $PATH
```

2.3 Building the library from source

There are two levels of rebuilding the library

1. Using a build environment to rebuild the library
2. Rebuilding from a cloned repo and rebuild the build environment

2.3.1 Rebuilding using an existing build environment

Rebuilding the library using a pre-configured build environment only requires `gcc` and `make` together with the standard C/C++ libraries to be installed.

The library source with suitable build-environment is distributed as a tar-ball

1. `libhpdf-src-x.y.z.tar.gz`

This tar-ball includes a build environment constructed with the GNU autotools. This means that after downloading the tar-ball you can rebuild the library as so:

```
$> ./configure && make
... (output from the configuration and build omitted) ...
```

and then (optionally) install the library

```
$ make install
```

2.3.2 Rebuilding from a cloned repo

Note

This is for experienced developers!

The repo does not include any of the generated files as the tar-ball does. This means that the following build tools need to be setup in order to fully rebuild from a cloned repo.

1. A complete set of GNU compiler chain (or on OSX clang)
2. the `GNU autotools` (`autoconf`, `automake`, `libtool`)
3. `Doxygen` in order to rebuild the documentation

Since it is completely out of the scope to describe the intricacies of the GNU autotools we will only show what to do assuming this tool chain has already been installed.

To simplify the potentially painful bootstrap of creating a full autotools environment from the cloned repo a utility script that does this is provided in the form of `scripts/bootstrap.sh`. After cloning the repo run (from the `libhpdf-tbl` directory)

```
./scripts/bootstrap.sh
```

This script will now run `autoreconf`, `automake`, `glibtoolize` as needed in order to create a full build environment. It will also run `configure` and if everything works as expected the last lines you will see (on OSX) will be

```
...
config.status: executing libtool commands
configure: -----
```

```

configure: INSTALLATION SUMMARY:
configure:   - Build configured for OSX.
configure:   - Can rebuild HTML docs with Doxygen.
configure:   - Can also create PDF docs (have LaTeX).
configure:   - Installing to /usr/local
configure: -----

```

The final step you need to do is compile the library

```
$> make
```

The simplest way to verify that everything works is to execute one of the example programs (in the `examples/` directory) as so:

```

$> ./examples/example01
Stroking 5 examples.
Sending to file "/tmp/example01.pdf" ...
Done.

```

If you would like to install the library make the `install` target

```
$> make install
```

This will install headers and library under `"/usr/local"` (unless the prefix was changed when running the `configure`)

2.4 Miscellaneous

2.4.1 Some notes on Compiling for debugging

Since the library builds with `libtool` and this tool will generate a wrapper shell script for each example to load the, not yet installed, library it also means this "executable" shell script cannot directly be used to debug with for example `gdb`.

The solution for this is to configure the library to only build static libraries which are directly linked with the example binaries and as such can be debugged as usual. This configuration is done with:

```
$> ./configure --enable-debug --disable-shared
```

After this all the examples will be statically linked and can be debugged as usual

An alternative way (as recommended in the [libtool manual](#)) is to launch the debugger with:

```
$> libtool --mode=execute gdb <example program>
```

As a convenience a script is provided to handle the debug build configuration [scripts/dbgbld.sh](#)

2.4.2 Some notes on updating the documentation

By design the documentation is not updated by the default make target in order minimize the build time during development. To rebuild the `html` documentation build the target

```
$> make html
```

and to rebuild the `PDF` version build the target

```
$> make pdf
```

Warning

There is a shell script [scripts/docupload.sh.in](#) that the author (i.e. me!) uses to upload the HTML and PDF documentation to the Github pages of the author. For obvious reason this script will not work for anyone else since it requires write access to the doc repo (through a SSL certificate).

2.4.3 Some notes on Windows build

The source files are suitable augmented to also compile on MS Windows with selective defines. However, since I have no longer access to a Windows system to verify the workings this is left as an exercise to the reader. Hence this should be considered as a best effort

2.4.4 Some notes on using C or C++ to build

The source files are also suitable augmented to compile on both a C and a C++ compiler. However, the default build environment is setup for a pure C library build. To add a configuration switch for this would be the sensible way to handle this. This is not done and again, is left as an exercise for the reader.

Chapter 3

Getting started

In this section we will introduce you to the basic usage of the `hpdftbl` library. We will start simple and work us all the way to complex tables and explain what is happening as we go along.

We will not assume any knowledge of the table library but **we will assume that you are familiar with the plain Haru PDF library**.

3.1 Creating a PDF page infrastructure

Before we start creating a table we need to setup a plain PDF page with the core HPDF library. The HPDF library has excellent documentation on how to do this, and we will use the same simple setup for all our examples. We will create a document in A4 size that have one page. For this we use a few utility functions and our `main()` will always have the following structure:

```
int
main(int argc, char **argv) {
    HPDF_Doc pdf_doc;
    HPDF_Page pdf_page;
    if (setjmp(env)) {
        return EXIT_FAILURE;
    }
    setup_hpdf(&pdf_doc, &pdf_page, TRUE);
    create_table_<NAME_OF_EXAMPLE>(pdf_doc, pdf_page);

    stroke_pdfdoc(pdf_doc, OUTPUT_FILE);
    return EXIT_SUCCESS;
}
```

In the example directory you can find the full code for the setup and stroke function in for example [tut_ex01.c](#). They are very basic and follows the standard hpdf library methodology. The `setup_hpdf()` creates a new document and a A4 page and the `stroke_pdfdoc()` strokes the document to the given output file.

In the following we will focus only on the `create_table_<NAME_OF_EXAMPLE>()` function which will use the two parameters `pdf_doc` and `pdf_page` to refer to the document and page to construct the table.

Note

In order to make the examples robust and compatible with both Windows and Linux/OSX systems some conditional compile instructions are also used but we will not display them while discussing the basic usage to keep the focus on what matters.

The full source for all examples are available in the `examples/` directory as well as in the Examples section of this manual.

3.2 Your first table

[tut_ex01.c](#)

The first example shows the absolute most basic usage. We create a 2x2 table in steps as follows

First we construct a table handle for a 2x2 table

```
const size_t num_rows = 2;
const size_t num_cols = 2;
hpdf_tbl_t tbl = hpdf_tbl_create(num_rows, num_cols);
```

Here we note that:

- The size of the table has to be determined before the table handle is created
- Most other table function will refer to this handle and we will always use the variable name `tbl` for this handle
- We use `size_t` instead of `int` since the table dimension is a size and as such can never be negative. In C it is always good practice to use `size_t` for positive numeric entities.

Once we have the table handle we can start to add content in these cells. For now let's just put a string that indicates the cells position.

```
hpdf_tbl_set_cell(tbl, 0, 0, NULL, "Cell 0x0");
hpdf_tbl_set_cell(tbl, 0, 1, NULL, "Cell 0x1");
hpdf_tbl_set_cell(tbl, 1, 0, NULL, "Cell 1x0");
hpdf_tbl_set_cell(tbl, 1, 1, NULL, "Cell 1x1");
```

Note

You can ignore the `NULL` argument for now (it will be explained shortly).

Here we note that:

- Cells are referred to starting from the top left cell that is cell (0x0)

Now it's time to size and position the table on the page. As a minimum you must specify the `x` and `y` position as well as the width of the table. The library is smart enough to automatically figure out the height (but it is also possible to force a larger height than strictly necessary)

The native coordinate system for PDF pages are given as the printing unit of DPI or *dots per inch*. By default, the resolution of a PDF is 72 DPI.

To make it easier to directly set the size and position in centimeters a convenience function `hpdf_tbl_cm2dpi()` can be used.

Note

For precision positioning it is more accurate to give the position and sizes in dots directly.

In this example we set the size and position in centimeters. We position in the top left of the table 1cm below and 1cm to the right of the top left corner of the paper and make the table 5cm wide as follows:

```
HPDF_REAL xpos = hpdfdbl_cm2dpi(1);
HPDF_REAL ypos = hpdfdbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
HPDF_REAL width = hpdfdbl_cm2dpi(5);
HPDF_REAL height = 0; // Calculate height automatically
```

Now, there are several important observations to be made here:

- The origin of the paper coordinate system is bottom left which is (0,0)
- The anchor position by default is the top-left corner of the table (this can be adjusted by calling `hpdfdbl_set_anchor_top_left(FALSE)` function which will make the bottom left the anchor point instead)
- We use a predefined constant `A4PAGE_HEIGHT_IN_CM` to position the table vertically 1 cm from the top of the paper
- We let the library calculate the minimum table height automatically (based on the font height used in the table)

Now the only thing remaining is to print or stroke the table to the page

```
hpdfdbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
```

and we are done!

If we put it all together it will give us the following basic table creation code

```
void
create_table_ex01(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 2;
    const size_t num_cols = 2;

    hpdfdbl_t tbl = hpdfdbl_create(num_rows, num_cols);
    hpdfdbl_set_cell(tbl, 0, 0, NULL, "Cell 0x0");
    hpdfdbl_set_cell(tbl, 0, 1, NULL, "Cell 0x1");
    hpdfdbl_set_cell(tbl, 1, 0, NULL, "Cell 1x0");
    hpdfdbl_set_cell(tbl, 1, 1, NULL, "Cell 1x1");
    HPDF_REAL xpos = hpdfdbl_cm2dpi(1);
    HPDF_REAL ypos = hpdfdbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdfdbl_cm2dpi(5);
    HPDF_REAL height = 0; // Calculate height automatically
    hpdfdbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

The generated table is shown in **Figure 1**. ([tut_ex01.c](#))

Cell 0x0	Cell 0x1
Cell 1x0	Cell 1x1

Figure 1: Your first table.

As we explained above the coordinate system is in postscript dots. For precision positioning it might be useful to visualize this grid on the page. By using the `hpdfdbl_stroke_grid()` function such a grid can be displayed on a page to help with positioning. If we add the grid to the page and show the upper left area of the paper with the grid we can view its positioning in the grid as shown in **Figure 2**.

Cell 0x0	Cell 0x1
Cell 1x0	Cell 1x1

Figure 2: Your first table in the page coordinate system showing the upper left part of the paper.

Since this is an A4 page it will have a height of roughly 841 points or 29.7cm

3.3 Your second table - disconnecting program structure from data

One drawback of the program in the first example above is that if we want to have a different table size we need to actually change the code since we need one function call to store the data to be displayed in each cell. Wouldn't it be better if we could just supply an array with the data we want to display?

The function to do just that is

```
hpdftbl_set_content(hpdftbl_t tbl, char **content)
```

The content data is a 1-dimensional array of string pointers. Where each row is consecutive in the array. For example to create dummy data indicating what array position goes into what cell you could use the following setup:

```
typedef char **content_t;
void setup_dummy_data(content_t *content, size_t rows, size_t cols) {
    char buff[255];
    *content = calloc(rows*cols, sizeof(char*));
    size_t cnt = 0;
    for (size_t r = 0; r < rows; r++) {
        for (size_t c = 0; c < cols; c++) {
            snprintf(buff, sizeof(buff), "Content %zu", cnt);
            (*content)[cnt] = strdup(buff);
            cnt++;
        }
    }
}
```

Note

We allocate each string dynamically in the dummy-data and since the program is just an illustration and terminates after the page has been created we never bother to free this memory. In a real life scenario this would of course be crucial!

We could then augment example 01 using this more efficient way to specify data as so:

```
void
create_table_ex02(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 2;
    const size_t num_cols = 2;
    hpdftbl_t tbl = hpdftbl_create(num_rows, num_cols);
    content_t content;
    setup_dummy_data(&content, num_rows, num_cols);
    hpdftbl_set_content(tbl, content);
    HPDF_REAL xpos = hpdftbl_cm2dpi(1);
    HPDF_REAL ypos = hpdftbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdftbl_cm2dpi(5);
    HPDF_REAL height = 0; // Calculate height automatically

    hpdftbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

tut_ex02.c

Running the code above in our infrastructure will give

Content 0	Content 1
Content 2	Content 3

Figure 3: Specifying data in a table with an array of string pointers.([tut_ex02.c](#))

In the above (small) example it might not have been a big save but if you have a table with 20x10 rows * cols then you will soon appreciate this way of specifying data.

There is even one more way of specifying data that in some situations are more efficient and allows a clear division between the table structure and look&feel and its data. This more efficient way is achieved by using cell callbacks either directly in individual cells or in one go by specifying the entire table as a data structure by using the `hpdftbl_stroke_from_data()` function. This will be described later when we discuss how to use callback functions.

But now it is time to explain the `NULL` value in the first example when we specified the content with the `hpdftbl_set_cell()` function.

3.4 Adding a header row

While it is possible (as discussed in section [Style and font setting](#) and [Fonts and Colors](#)) to manually adjust the font, size, style, background etc. on each cell individually there is a convenient shortcut to create a basic table with a header using the `hpdftbl_use_header()` function. By modifying the code above and add this line we get the following code and resulting table

```
void
create_table_ex11(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 4;
    const size_t num_cols = 4;
    hpdftbl_t tbl = hpdftbl_create(num_rows, num_cols);
    hpdftbl_use_header(tbl, TRUE);
    content_t content;
    setup_dummy_data(&content, num_rows, num_cols);
    hpdftbl_set_content(tbl, content);
    HPDF_REAL xpos = hpdftbl_cm2dpi(1);
    HPDF_REAL ypos = hpdftbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdftbl_cm2dpi(A4PAGE_WIDTH_CM - 5);
    HPDF_REAL height = 0; // Calculate height automatically

    hpdftbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

The resulting table can be seen in **Figure 4**. We also modified the dummy data to have the word "Header" in the first row (for details see [tut_ex02_1.c](#))

Header 0	Header 1	Header 2	Header 3
Content 0,0	Content 0,1	Content 0,2	Content 0,3
Content 1,0	Content 1,1	Content 1,2	Content 1,3
Content 2,0	Content 2,1	Content 2,2	Content 2,3

Figure 4: Adding automatic header formatted row ([tut_ex02_1.c](#))

3.5 Using labels in the table cells

A variant of a table is to present data with a short label describing what kind of data is displayed. This is often used when a table is used to present a dataform. An example of this is shown in **Figure 4**. below.

Label	Label
Cell 0,0	Cell 0,1
Cell 1,0	Cell 1,1

Figure 4: Specifying labels for each cell. ([tut_ex03.c](#))

Adding labels requires three things:

1. Enable the "label" feature with a call to `hpdftbl_use_labels(tbl, TRUE);`
2. Add the text that should be the label. Specifying these labels can either be done using the `hpdftbl_set_cell()` function as in

```
hpdftbl_set_cell(tbl, 0, 0, "Label 1", "Cell 0x0");
hpdftbl_set_cell(tbl, 0, 1, "Label 2", "Cell 0x1");
hpdftbl_set_cell(tbl, 1, 0, "Label 3", "Cell 1x0");
hpdftbl_set_cell(tbl, 1, 1, "Label 4", "Cell 1x1");
```

or it can be done using the analog of specifying the labels in an array using the function `hpdftbl_set_labels()`.
3. In addition there is one more key setting and that is whether the left cell border should be the whole cell or just the label height as was shown in **Figure 4**. above. This option is specified with `hpdftbl_use_labelgrid()`. By default the left border is from top to bottom. The differences between the two variants is shown in **Figure 5**. below.

Label	Label
Cell 0,0	Cell 0,1
Cell 1,0	Cell 1,1

Figure 5: The two variants of left cell border with labels.

Except for the simplest of tables both the table content and the labels should be specified in an array.

We therefore start by amending our dummy data creation function to also create the data for the labels. It will now look like this:

```
typedef char **content_t;
void
setup_dummy_data(content_t *content, content_t *labels,
                 size_t rows, size_t cols) {
    char buff[255];
    *content = calloc(rows*cols, sizeof(char*));
    *labels = calloc(rows*cols, sizeof(char*));
    size_t cnt = 0;
    for (size_t r = 0; r < rows; r++) {
        for (size_t c = 0; c < cols; c++) {
            snprintf(buff, sizeof(buff), "Content %zu", cnt);
            (*content)[cnt] = strdup(buff);
            snprintf(buff, sizeof(buff), "Label %zu", cnt);
            (*labels)[cnt] = strdup(buff);
            cnt++;
        }
    }
}
```

In the same way as before we call the functions to specify both the content and the labels

```
setup_dummy_data(&content, &labels, num_rows, num_cols);
hpdftbl_set_content(tbl, content);
hpdftbl_set_labels(tbl, labels);
```

and finally we also enable labels and the short variant of the left cell border

```
hpdftbl_use_labels(tbl, TRUE);
hpdftbl_use_labelgrid(tbl, TRUE);
```

the remaining code we can leave untouched. With this we get the result shown in **Figure 4**. with the full code for the table shown below.

```
void
create_table_ex04(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 2;
    const size_t num_cols = 2;

    hpdftbl_t tbl = hpdftbl_create(num_rows, num_cols);
    content_t content, labels;
    setup_dummy_data(&content, &labels, num_rows, num_cols);
    hpdftbl_set_content(tbl, content);
    hpdftbl_set_labels(tbl, labels);

    hpdftbl_use_labels(tbl, TRUE);
    hpdftbl_use_labelgrid(tbl, TRUE);
    HPDF_REAL xpos = hpdftbl_cm2dpi(1);
    HPDF_REAL ypos = hpdftbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdftbl_cm2dpi(5);
    HPDF_REAL height = 0; // Calculate height automatically
    hpdftbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

[tut_ex04.c](#)

3.6 Adding a table title

We have one last part of the table we haven't yet used and that is the table title. In the previous examples we created a table using `hpdftbl_create()` but there is also `hpdftbl_create_title()`. A title can also be added to an existing table (or perhaps updated) using `hpdftbl_set_title()`

To create a table with a title

```
char *table_title = "tut_ex05: 2x2 table";
hpdftbl_t tbl = hpdftbl_create_title(num_rows, num_cols, table_title);
```

A table title occupies the top of the table in it's own row which isn't part of the counting if the normal columns.

Figure 6: Adding a title for the table. ([tut_ex05.c](#))

It is possible to adjust the colors, font-properties, and alignments of the title with two additional functions `hpdftbl_set_title_style()` and `hpdftbl_set_title_halign()`

3.7 Adjusting fonts and colors

The one thing we have skipped over so far and just used the defaults is the look&feel of the table as far as colors and fonts go. It is possible to adjust these setting at several different granularities. It is possible to

1. Adjust the entire table in one go using `hpdftbl_set_content_style()`
2. Adjust one entire column using `hpdftbl_set_col_content_style()`
1. Adjust one entire row in using `hpdftbl_set_row_content_style()`
1. Adjust individual cells using `hpdftbl_set_content_style()`

It is also possible to adjust the color and thickness of the borders but we will not discuss this more here and instead refer the reader to the API documentation.

Note

We should also mention that there is a concept of a look&feel theme for the table which can be used to adjust all the parameters at once. This is discussed in "Using themes".

Chapter 4

Adjusting the layout of the table

The table can be modified both by adjusting the width of columns as well as how many rows and columns a cell is spanning.

4.1 Cell and row spanning

A common way to modify a table is to have a cell spanning either multiple columns, multiple rows or both. This is done using the function

```
int
hpdftbl_set_cellspan(const hpdftbl_t tbl,
                    size_t r, size_t c,
                    size_t rowspan, size_t colspan)
```

The specified (r, c) is the row and column of the upper left cell in merged cell that spans `rowspan` rows and `colspans` columns. This is also the row and col coordinates used to accessing the combined cell.

To illustrate this we will create a table with seven rows and five columns. We will merge three cells using these cell-spannings:

```
hpdftbl_set_cellspan(tbl, 0, 0, 1, 3);
hpdftbl_set_cellspan(tbl, 2, 2, 3, 3);
hpdftbl_set_cellspan(tbl, 3, 0, 4, 1);
```

For the data we will use the same setup as in [tut_ex06.c](#) This will then give the result shown in **Figure 8**.

Figure 8: *Having cells spanning multiple rows and columns. [tut_ex07.c](#)*

4.2 Adjusting column width

By default or column widths are divided equally regardless of the content. The width can be adjusted by explicitly set the relative width of a column as a percentage of the total table width. This is done with the function

```
int
hpdftbl_set_colwidth_percent(const hpdftbl_t tbl,
                            const size_t c,
                            const float w);
```

The width is set as a percentage of the total width and is specified as a floating point value in the range [0.0, 100.0]. An example of this is shown in **Figure 9**. below. An arbitrary number of columns can be given a width. For best result leave at least one column undefined and whatever remains of the table width will be assigned to that column. There is an error to try to specify a total column width $> 100\%$.

Figure 9: *Adjusting width of first columns. [tut_ex08.c](#) *

Chapter 5

Content and label callbacks

In the "[Getting started](GettingStarted.md)" chapter we discussed the preferred way to specify data and labels in table using data arrays. This is a very good way to populate a table in the cases the data is fairly static.

For data that is more dynamic and determined at runtime it is of course possible to construct the data array but the table library have one better way to do this and that is to set up label and content callbacks.

5.1 Introducing content callback functions

Content callbacks are functions that are called by the table library for each cell and returns a string which is used as the data to be displayed. The signature for a cell callback is defined by the type `hpdftbl_content_callback_t` which is a pointer to a function defined as:

```
typedef char * (*hpdftbl_content_callback_t)(void *, size_t, size_t);
```

To understand this lets start with a callback function that follows this signature.

```
char *  
my_cell_cb(void *tag, size_t row, size_t col) { ... }
```

The parameters in the callback are

1. **tag**: Since a callback sometimes must know from what table or in what circumstances it is called it is possible to add a "tag" to each table. This could be something as simple as pointer to a numeric identifier that uniquely identifies the table or perhaps a pointer to some function that retrieves data for this particular table. The `tag` for a table is specified with the `hpdftbl_set_tag()` function. When the callback is made this table tag is provided as the first argument.
2. **row**: The cell row
3. **col**: The cell column

It is possible to specify a callback to adjust content, style, and labels. A callback function can be specified either for both the entire table or for individual cells. The API to specify these callbacks are:

1. `hpdftbl_set_content_cb()`:
Specify a content callback for the entire table.

2. `hpdftbl_set_content_style_cb()`:
Specify a style callback for the entire table.
3. `hpdftbl_set_label_cb()`:
Specify a label callback for the entire table.
4. `hpdftbl_set_cell_content_cb()`:
Specify callback for an individual cell. A cell callback will override a potential table callback.
5. `hpdftbl_set_cell_content_style_cb()`:
Specify a style callback for an individual cell. A cell callback will override a potential table callback.
6. `hpdftbl_set_canvas_cb()`: This is an advanced callback to allow for low level painting directly on the canvas that is the cell area. The arguments to the callback is different as it includes the bounding-box for the cell area. We will not further discuss this.

Note

Returned content string. When a content string is added in the table it is added as a copy of the string pointed to by the returned string pointer from the callback function. It is therefore perfectly possible to have a static allocated buffer in the callback function that is used to construct the content. When the table is destroyed using `hpdftbl_destroy()` all used memory will be freed.

5.2 A content callback example

Let's now construct a simple example where the content and the labels are specified with callbacks.

We will create callbacks that will add a date string to the top left cell and just some dummy content in the rest of the cells. We could do this in two ways.

1. Add a generic table callback for all cells and then in that callback check if the row and column is (0,0) i.e. top-left and in that case create a date.
2. Add a generic table callback for all cells and then add a specific cell callback with the date for the (0,0) cell.

To illustrate both methods we will use method 1 for the labels and method 2 for the content.

Let's first create the three callback functions we need

```
static char * cb_date(void *tag, size_t r, size_t c) {
    static char buf[64];
    time_t t = time(NULL);
    ctime_r(&t, buf);
    return buf;
}

static char * cb_content(void *tag, size_t r, size_t c) {
    static char buf[32];
    snprintf(buf, sizeof buf, "Content %02zu x %02zu", r, c);
    return buf;
}

static char * cb_labels(void *tag, size_t r, size_t c) {
    static char buf[32];
    if (0==r && 0==c) { // Top-left cell
        snprintf(buf, sizeof buf, "Date:");
    } else {
        snprintf(buf, sizeof buf, "Label %zu x %zu:", r, c);
    }
    return buf;
}
```

We note that we ignore the tag argument. Since we only have one table there is no need to use a tag to different from which table a callback comes.

For the table structure we will re-use our previous example and create a 2x2 table, and we get the following table creation code:

```
void
create_table_ex06(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 2;
    const size_t num_cols = 2;
    char *table_title = "tut_ex06: 2x2 table with callbacks";
    hpdf_tbl_t tbl = hpdf_tbl_create_title(num_rows, num_cols, table_title);
    hpdf_tbl_use_labels(tbl, TRUE);
    hpdf_tbl_use_labelgrid(tbl, TRUE);
    hpdf_tbl_set_label_cb(tbl, cb_labels);
    hpdf_tbl_set_content_cb(tbl, cb_content);
    hpdf_tbl_set_cell_content_cb(tbl, 0, 0, cb_date);
    HPDF_REAL xpos = hpdf_tbl_cm2dpi(1);
    HPDF_REAL ypos = hpdf_tbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdf_tbl_cm2dpi(12);
    HPDF_REAL height = 0; // Calculate height automatically

    hpdf_tbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}

( tut_ex05.c)
```

Running this example gives the result shown in **Figure 7**. below

Year	Month	Day	Hour
2022	05	04	00

Figure 7: Using callbacks to populate the table and labels.

Chapter 6

Error handling

All library function will return an error code < 0 and also set a global variable to a specific error code that can later be read by an error handler. In order to translate the error to a human-readable string the function `hpdftbl_get_last_errcode()` can be used as the following error handling snippet exemplified by a call to

```
hpdftbl_set_colwidth_percent()
if( hpdftbl_set_colwidth_percent(tbl, 5, 110) ) {
    // This is an error
    char *err_str;
    int err_code, r, c;
    err_code=hpdftbl_get_last_errcode(&err_str, &r, &c);
    if( err_code ) {
        printf("ERROR*: \"%s\" at cell (%d, %d)",err_str,r,c);
        exit(1);
    }
}
```

As can be seen from the snippet above it would yield quite longwinding error handling if one where to check every single library call. Instead, there is the option of installing an error handler that would be called in the event of an error.

The table error handle has the signature

```
void hpdftbl_error_handler_t)(hpdftbl_t tbl, int r, int c, int err)
```

Where the arguments are

1. `tbl` The table in where the error happened. **Note** This might be `NULL` since not all errors happen within the context of a table
2. `r,c` The row and column if the error happens in a specified cell, otherwise these will be `(-1,-1)`
3. `err` The internal error code. This is always a negative number.

The error handler is set with the `hpdftbl_set_errhandler()` method. An example of a very simple error handle is:

```
void
my_table_error_handler(hpdftbl_t t, int r, int c, int err) {
    if( r>-1 && c>-1 ) {
        fprintf(stderr, "*** Table Error: [%d] \"%s\" at cell (%d, %d)\n", err, hpdftbl_get_errstr(err), r, c);
    } else {
        fprintf(stderr, "*** Table Error: [%d] \"%s\" \n", err, hpdftbl_get_errstr(err));
    }
    exit(1);
}
```

In the above error handler we have made use of the utility function `hpdftbl_get_errstr()` that translates the internal error code to a human-readable string.

In fact this exact error handler is available as a convenience in the library under the name `hpdftbl_default_table_error_handler` so to use this trivial error handler just add the following line to your code

```
hpdftbl_set_errhandler(hpdftbl_default_table_error_handler);
```

More advanced error handler must be written for the particular application they are to be used in.

Note

A common way to extend the error handling is to log the errors to syslog. When the library is used on OSX from 11.0 and onwards it should be remembered that OSX is broken by design as far as syslog logging is concerned. Apple in its wisdom introduced "Unified logging" which breaks the `syslog()` function and no logging is ever produced in the filesystem directly (i.e. to `/var/log/system.log`).

Instead the only way to view the logs is by using the utility `log`. So in order to view the log from a particular application the following command has to be given

```
'log stream --info --debug --predicate 'sender == "APPLICATION_NAME"' --style syslog`
```

6.1 Translating HPDF error codes

The standard error handler for the plain HPDF library is specified when a new document is created, for example as'

```
...
pdf_doc = HPDF_New(error_handler, NULL);
HPDF_SetCompressionMode(pdf_doc, HPDF_COMP_ALL);
...
```

The error handler signature is defined by Haru PDF library as

```
static void error_handler(HPDF_STATUS error_no, HPDF_STATUS detail_no, void *user_data);
```

It is then up to the application code to decide how to handle the error. To simplify the handling of core HPDF error the library also offer a convenience function to translate the Haru library error code into a human-readable string. This function is

```
const char *
hpdftbl_hpdf_get_errstr(const HPDF_STATUS err_code)
```

and is used in the error handler in all the examples.

6.2 Example of setting up error handler

The following table creation code have a deliberate error in that it tries to assign a total column width of more than 100% which of course isn't possible.

```
void
create_table_ex10(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 4;
    const size_t num_cols = 4;
    hpdftbl_set_errhandler(hpdftbl_default_table_error_handler);
    hpdftbl_t tbl = hpdftbl_create(num_rows, num_cols);
    hpdftbl_set_colwidth_percent(tbl, 0, 40);
    hpdftbl_set_colwidth_percent(tbl, 1, 70);
    content_t content;
    setup_dummy_data(&content, num_rows, num_cols);
    hpdftbl_set_content(tbl, content);
    HPDF_REAL xpos = hpdftbl_cm2dpi(1);
    HPDF_REAL ypos = hpdftbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdftbl_cm2dpi(A4PAGE_WIDTH_CM - 4);
    HPDF_REAL height = 0; // Calculate height automatically

    hpdftbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

This is available in the example directory as [tut_ex10.c](#). When this code is executed the following will be printed to standard out and the process will be stopped.

```
*** Table Error: [-12] "Total column width exceeds 100%"
```

Chapter 7

Style and font setting

The format of each cell can be adjusted with respect to:

1. Font-family and style (size, bold, italic etc.)
2. Font- and background-color
3. Border thickness and color

In this section we will focus on how to adjust the font and background color. The style can be adjusted both for the entire table at once and also for individual cells. The individual cell style will always override the table cell style.

The primary API to adjust the table style are:

```
// Set background color for entire table
int hpdftbl_set_background(hpdftbl_t t,
                           HPDF_RGBColor background);

// Set label style for the entire table
int hpdftbl_set_label_style(hpdftbl_t t,
                           char *font, HPDF_REAL fsize,
                           HPDF_RGBColor color, HPDF_RGBColor background);

// Set content style for entire table
int hpdftbl_set_content_style(hpdftbl_t t,
                             char *font, HPDF_REAL fsize,
                             HPDF_RGBColor color, HPDF_RGBColor background);

// Set content style for specified cell
int hpdftbl_set_cell_content_style(hpdftbl_t t,
                                   size_t r, size_t c,
                                   char *font, HPDF_REAL fsize,
                                   HPDF_RGBColor color, HPDF_RGBColor background);

// Set content style for specified row in table
int hpdftbl_set_row_content_style(hpdftbl_t t,
                                  size_t r,
                                  char *font, HPDF_REAL fsize,
                                  HPDF_RGBColor color, HPDF_RGBColor background);

// Set content style for specified column in table
int hpdftbl_set_col_content_style(hpdftbl_t t,
                                  size_t c,
                                  char *font, HPDF_REAL fsize,
                                  HPDF_RGBColor color, HPDF_RGBColor background);
```

7.1 Adjusting fonts and colors

Fonts are specified as a string with the type font family name as recognized by the core Haru PDF library, e.g. "Times-Roman", "Times-Italic", "Times-Bold" etc. As a convenience not to have to remember the exact font name strings the following three font family are defined as HPDF_FF_* where the last part of the name is specified as the following table shows

Font family	Italic	Bold	BoldItalic
TIMES	TIMES_ITALIC	TIMES_BOLD	TIMES_BOLDITALIC
HELVETICA	HELVETICA_ITALIC	HELVETICA_BOLD	HELVETICA_BOLDITALIC
COURIER	COURIER_ITALIC	COURIER_BOLD	COURIER_BOLDITALIC

Table 1: Predefined font family and variants

So to use the "Helvetica" font family the constant "`HPDF_FF_HELVETICA`" is used and so on.

Colors are specified in the standard Haru way, i.e as an instance of the structure "`HPDF_RGBColor`". As another convenience the following colors are predefined

```
#define HPDF_COLOR_DARK_RED      (HPDF_RGBColor) { 0.6f, 0.0f, 0.0f }
#define HPDF_COLOR_RED          (HPDF_RGBColor) { 1.0f, 0.0f, 0.0f }
#define HPDF_COLOR_LIGHT_GREEN  (HPDF_RGBColor) { 0.9f, 1.0f, 0.9f }
#define HPDF_COLOR_GREEN        (HPDF_RGBColor) { 0.4f, 0.9f, 0.4f }
#define HPDF_COLOR_DARK_GRAY    (HPDF_RGBColor) { 0.2f, 0.2f, 0.2f }
#define HPDF_COLOR_LIGHT_GRAY   (HPDF_RGBColor) { 0.9f, 0.9f, 0.9f }
#define HPDF_COLOR_GRAY         (HPDF_RGBColor) { 0.5f, 0.5f, 0.5f }
#define HPDF_COLOR_SILVER       (HPDF_RGBColor) { 0.75f, 0.75f, 0.75f }
#define HPDF_COLOR_LIGHT_BLUE   (HPDF_RGBColor) { 1.0f, 1.0f, 0.9f }
#define HPDF_COLOR_BLUE         (HPDF_RGBColor) { 0.0f, 0.0f, 1.0f }
#define HPDF_COLOR_WHITE        (HPDF_RGBColor) { 1.0f, 1.0f, 1.0f }
#define HPDF_COLOR_BLACK        (HPDF_RGBColor) { 0.0f, 0.0f, 0.0f }
```

So for example to set the overall default font to 12pt Times Roman with black text on white bottom the following call must be made

```
...
hpdf_tbl_set_content_style(tbl, HPDF_FF_TIMES, 12, HPDF_COLOR_BLACK, HPDF_COLOR_WHITE);
...
```

Since RGB for colors are specified as a floating point number in range [0.0, 1.0] and most color table give colors as a integer triple there is exists a macro to make this conversion easier

```
#define HPDF_COLOR_FROMRGB(r,g,b) (HPDF_RGBColor){r/255.0,g/255.0,b/255.0}
```

which will allow the easier specification of color such as

```
HPDF_RGBColor color_saddle_brown = HPDF_COLOR_FROMRGB(139,69,19);
```

7.2 Using style callbacks

In much the same way as callbacks can be used for specifying content and labels so can a callback be used to specify the style of a cell or the entire table.

A style callback has the following signature

```
_Bool
hpdf_tbl_content_style_callback_t(void *tag, size_t r, size_t c, char *content, hpdf_text_style_t *style);
```

In order for the settings to be applied the callback has to return a boolean TRUE value.

If the callback returns FALSE the settings will **not** be applied.

The parameters are used as follows:

- The `tag` parameter has the same meaning as for content and label callbacks; an optional unique identifier for the table.** The `tag` parameter should always be checked for possible NULL value since it is not required for a table to have a tag.
- The `r` and `c` arguments are the row and column of the cell the callback is made for
- The `content` is the cell content string. The rationale for including this in the style callback is to allow for highlighting in the table of specific data. It could for example be something as simple as wanting to mark all values above a certain threshold with another background color in the table to draw attention.

- Finally the actual style is encompassed by the `hpdf_text_style_t` and is defined as the following structure

```
typedef struct text_style {
    char *font;
    HPDF_REAL fsize;
    HPDF_RGBColor color;
    HPDF_RGBColor background;
    hpdf_tbl_text_align_t halign;
} hpdf_text_style_t;
```

The style callbacks can exactly as the content callback be specified for either the entire table or for a specific cell. A cell callback will always override a table callback. The two functions to setup style callbacks are

```
int
hpdf_tbl_set_cell_content_style_cb(hpdf_tbl_t tbl,
                                   size_t r, size_t c,
                                   hpdf_tbl_content_style_callback_t cb);

int
hpdf_tbl_set_content_style_cb(hpdf_tbl_t tbl,
                              hpdf_tbl_content_style_callback_t cb);
```

Note

Due to some technicalities **the style callbacks are called twice** per cell. The first call is necessary to setup the background canvas and at that stage the content is not necessarily known since it could be later specified with a content callback. The first time the callback is made the `content` parameter is always guaranteed to be `NULL`

7.2.1 Style callback example

An example of a callback function to set a background color for a header row/column for a table could for example be done as follows

```
_Bool
cb_style(void *tag, size_t r, size_t c, char *content, hpdf_text_style_t *style) {
    // Format the header row/column with a grey background and Helvetica font while the rest of the
    // table uses "Times Roman"
    if ( 0==r || 0==c ) { // Headers
        style->font = HPDF_FF_HELVETICA_BOLD;
        style->fsize = 12;
        style->color = HPDF_COLOR_BLACK;
        style->background = HPDF_COLOR_LIGHT_GRAY;
        if ( c > 0 )
            style->halign = CENTER;
        else
            style->halign = LEFT;
    } else { // Content
        style->font = HPDF_FF_TIMES;
        style->fsize = 11;
        style->color = HPDF_COLOR_BLACK;
        style->background = HPDF_COLOR_WHITE;
        style->halign = CENTER;
    }
    return TRUE;
}
```

and the table setup code can then be written as

```
void
create_table_ex09(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 4;
    const size_t num_cols = 4;
    hpdf_tbl_t tbl = hpdf_tbl_create(num_rows, num_cols);
    hpdf_tbl_set_content_cb(tbl, cb_content);
    hpdf_tbl_set_content_style_cb(tbl, cb_style);
    hpdf_tbl_set_colwidth_percent(tbl, 0, 40);
    HPDF_REAL xpos = hpdf_tbl_cm2dpi(1);
    HPDF_REAL ypos = hpdf_tbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdf_tbl_cm2dpi(A4PAGE_WIDTH_CM - 4);
    HPDF_REAL height = 0; // Calculate height automatically
    hpdf_tbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

The resulting table is shown in **Figure 10**. below.

	Header 01	Header 02	Header 03
Extra long Header 04	Content 01	Content 02	Content 03
Extra long Header 04	Content 01	Content 02	Content 03
Extra long Header 04	Content 01	Content 02	Content 03

Figure 10: Using a style callback to highlight header rows & columns. [tut_ex09.c](#)

7.3 Using style themes

A theme (or style theme) is a definition of the "look & feel" of a table. It doesn't affect the structure of the table such as the size of the table or how many columns or rows a cell spans. It is practical shortcut when many different tables should be displayed in the same style. It allows the compact specification of the table by applying a theme to the table instead of having to call multiple functions to achieve the same thing. In addition if the design should be changed there is only one place to update instead of for each table.

Note

There is not yet any support to read and write themes from a file. A theme is therefore an *in memory* structure useful within one program.

A theme controls the following aspects of a table

- The content and label text style
- The header and title text style
- The inner and outer border style
- The usage (or not) of labels and whether or not the shorter label grid lines should be used
- If a header row should be used or not
- If a title should be used or not

if you have multiple table in a document it is possible to create a *table theme* which consists of some core styling of a table that can be reused.

All information for a theme is encapsulated in the `hpdftbl_theme` structure.

This structure can be set up manually and then applied to a table. However, the recommended way is to first use the "theme getter" function to get the default theme and then modify this default theme as needed since it allows you to only have to update the parts affected by a change.

The functions to work with a theme are as follows:

```
// Apply the given theme to a table
int
hpdftbl_apply_theme(hpdftbl_t t, hpdftbl_theme_t *theme);
// Get the default theme into a new allocated structure
hpdftbl_theme_t *
hpdftbl_get_default_theme(void);
// Destroy the memory used by a theme
int
hpdftbl_destroy_theme(hpdftbl_theme_t *theme);
```

Note

It is the responsibility of the user of the library to destroy the theme structure by ensuring that `hpdftbl_destroy_theme()` is called when a theme goes out of scope.

The default font styles for the default theme are shown in table 1.

Style	Font	Size	Color	Background	Alignment
content	HPDF_FF_COURIER	10	Black	White	Left
label	HPDF_FF_TIMES_ITALIC	9	Dark gray	White	Left
header	HPDF_FF_HELVETICA_BOLD	10	Black	Light gray	Center
title	HPDF_FF_HELVETICA_BOLD	11	Black	Light gray	Left

Table 1: Default font styles.

Theme parameter	Default value
use_labels	FALSE
use_label_grid_style	FALSE
use_header_row	FALSE

Table 2: Default table structure parameters.

Border	Color	Width (pt)
inner_border	Grey	0.7
outer_grid	Dark Grey	1.0

Table 3: Default border parameters.

7.4 Adjusting grid line styles

There are four distinct set of grid lines as far as the library is concerned.

1. The outer gridline (or border) around the table, and
2. The inner vertical grid line
3. The inner horizontal grid line
4. The inner top grid line (not the outer border!)

All these types of gridlines are styled in the same way using the functions

```
int
hpdftbl_set_inner_tgrid_style(hpdftbl_t t,
                             HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle);

int
hpdftbl_set_inner_vgrid_style(hpdftbl_t t,
                              HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle);

int
hpdftbl_set_inner_hgrid_style(hpdftbl_t t,
                              HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle);

int
hpdftbl_set_inner_grid_style(hpdftbl_t t,
                             HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle);
```

Each type of gridline can be adjusted with line width, color and style. The last function in the list, `hpdftbl_set_inner_grid_style()`, is a convenience function that sets both the vertical and horizontal inner lines in one call.

The table below illustrates the various dashed line styles available and their names. See also `hpdftbl_dashstyle` and grid style functions `hpdftbl_set_inner_grid_style()`, `hpdftbl_set_inner_vgrid_style()` and `hpdftbl_set_inner_hgrid_style()`

Dash Style	Illustration
LINE_SOLID	xxx
LINE_DOT1	"x_x_x_"

Dash Style	Illustration
LINE_DOT2	x__x__x__
LINE_DOT3	"x____x____x____
LINE_DASH1	xx__xx__xx__
LINE_DASH2	xx____xx____xx____
LINE_DASH3	xxxx__xxxx__xxxx__
LINE_DASH4	xxxx____xxxx____xxxx____
LINE_DASHDOT1	xxxxx__xx__xxxxx__xx__xxxxx__xx__
LINE_DASHDOT2	xxxxxxxx__xxx__xxxxxxxx__xxx__xxxxxxxx__xxx__← ____

The following example ([tut_ex20.c](#)) makes use of these settings as shown below

```
void
create_table_ex20(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 5;
    const size_t num_cols = 4;
    hpdf_tbl_t tbl = hpdf_tbl_create(num_rows, num_cols);
    content_t content;
    setup_dummy_data(&content, num_rows, num_cols);
    hpdf_tbl_set_content(tbl, content);
    hpdf_tbl_set_inner_vgrid_style(tbl, 0.7, HPDF_COLOR_DARK_GRAY, LINE_SOLID);
    hpdf_tbl_set_inner_hgrid_style(tbl, 0.8, HPDF_COLOR_GRAY, LINE_DOT1);
    hpdf_tbl_set_inner_tgrid_style(tbl, 1.5, HPDF_COLOR_BLACK, LINE_SOLID);
    hpdf_tbl_set_outer_grid_style(tbl, 1.5, HPDF_COLOR_BLACK, LINE_SOLID);
    HPDF_REAL xpos = hpdf_tbl_cm2dpi(1);
    HPDF_REAL ypos = hpdf_tbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdf_tbl_cm2dpi(10);
    HPDF_REAL height = 0; // Calculate height automatically
    // Stroke the table to the page
    hpdf_tbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

and when run will result in the following table:

Content 0	Content 1	Content 2	Content 3
Content 4	Content 5	Content 6	Content 7
Content 8	Content 9	Content 10	Content 11
Content 12	Content 13	Content 14	Content 15
Content 16	Content 17	Content 18	Content 19

Chapter 8

Tables layout from data

So far we have constructed the layout of table by issuing API calls per table to setup, for example, the column widths and what cells should merge with what other cells and so on. Previously we saw that data to be put in the table could be specified by either directly issuing API calls per cell, using a 2D array that we populate with data and then finally use callbacks to generate the data in the cells.

The final and most powerful way of constructing a table is to define the table structure as data. This *structural data* together with a style theme can completely define a table.

This will allow the dynamic construction of tables with only one API call insted of the multiple call required to construct a table the usual way. It can initially seem more complex but for advanced table this is indeed a much simpler and easy to maintain. In fact, this will allow a table to bed defined entirely in a database and makes it possible to adjust tha table as the data changes without ever updating the code (or recompile).

8.1 Defining a table in data

There are two data structure that are used when defining a table. First there is a data structure for the overall table specifics and then in that structure a structure to specify the layout of each cell. In addition, a theme needs to be defined (see section on [Themes](#)). It is possible to omit the theme by specifying `NULL` in which case the default theme will be used.

To stroke a table from data the following API call is used

```
int
hpdftbl_stroke_from_data(HPDF_Doc pdf_doc, HPDF_Page pdf_page, hpdftbl_spec_t tbl_spec, hpdftbl_theme_t
    *theme);
```

In order to populate the table with suitable data callback functions are used (as described in section ??)

The overall table is first defined as an instance of

```
typedef struct hpdftbl_spec {
    char *title;
    _Bool use_header;
    _Bool use_labels;
    _Bool use_labelgrid;
    size_t rows;
    size_t cols;
    HPDF_REAL xpos;
    HPDF_REAL ypos;
    HPDF_REAL width;
    HPDF_REAL height;
    hpdftbl_content_callback_t content_cb;
    hpdftbl_content_callback_t label_cb;
    hpdftbl_content_style_callback_t style_cb;
    hpdftbl_callback_t post_cb;
    hpdftbl_cell_spec_t *cell_spec;
} hpdftbl_spec_t;
```

Then each cell (referenced above in the `cell_spec` field) is defined as an instance of

```
typedef struct hpdf_tbl_cell_spec {
    size_t row;
    size_t col;
    unsigned rowspan;
    unsigned colspan;
    char *label;
    hpdf_tbl_content_callback_t content_cb;
    hpdf_tbl_content_callback_t label_cb;
    hpdf_tbl_content_style_callback_t style_cb;
    hpdf_tbl_canvas_callback_t canvas_cb;
} hpdf_tbl_cell_spec_t;
```

8.2 A first example of defining table as data

To understand how this is done lets start to define a basic 3x3 table with header row (so 4x3 in total) as data. First we create an instance of the table data

```
hpdf_tbl_spec_t tbl_spec = {
    // Title and header flag
    .title=NULL, .use_header=TRUE,
    // Label and labelgrid flags
    .use_labels=FALSE, .use_labelgrid=FALSE,
    // Row and columns
    .rows=4, .cols=3,
    // xpos and ypos
    .xpos=hpdf_tbl_cm2dpi(1), .ypos=hpdf_tbl_cm2dpi(A4PAGE_HEIGHT_CM-2),
    // width and height
    .width=hpdf_tbl_cm2dpi(15), .height=0,
    // Content and label callback
    .content_cb=cb_content, .label_cb=cb_label,
    // Style and table post creation callback
    .style_cb=NULL, .post_cb=NULL,
    // Pointer to optional cell specifications
    .cell_spec=NULL
};
```

Note

In the table definition we use the C99 feature of specifying the field name when defining data in a structure.

Then the actual API call is trivial to what we seen before and consists of only one line of code

```
void
create_table_ex13_1(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    hpdf_tbl_stroke_from_data(pdf_doc, pdf_page, &tbl_spec, NULL);
}
```

The result is as expected and shown in **Figure 13** but with much less code!

Header 0001	Header 0001	Header 0002
Content 0000	Content 0001	Content 0002
Content 0000	Content 0001	Content 0002
Content 0000	Content 0001	Content 0002

Figure 13: *Defining a table with a data structure `tut_ex13_1.c`*

8.3 A second example of defining a table as data

In the previous example we kept it simple didn't specify any format or content for a table cell. Let us therefore create a slightly more complex example where we create a form which easily could be used to display data records from a DB.

The nice thing about separating layout and table structure from the data population in the callbacks is that this can almost be seen as a poor mans model-view-controller where the table structure is completely separate from the

A good way to start designing a table is to make a sketch on how it should look. Our goal is to crete the table structure as shown in the empty table in **Figure 14** below

Figure 14: Sketch of table to be designed

To get this layout we use a basic table with :

1. Five rows and four columns
2. No header and no title
3. We use labels and label grids

To make it easier to see how to construct the table we can overlay the sketch with a grid shown in blue in **Figure 15**. As can be seen this is a basic 5x4 table where a number of cells span multiple columns.

Figure 15: Sketch of table to be designed with 5x4 table overlayed

To start we setup the table specification as in the previous example with necessary changes. We will also need to specify cell specifications this time and we assume those are available in an array of cell structures called `cell_specs`.

Before we specify the table structure we have one design decision to make. For the callbacks we can either use the table callback for all cells and check row and column to get the appropriate data or we can add individual callbacks for each cell. The first case has the advantage to only need one callback function (but lot of tests) and the second that each callback will be small and focused to get the data for that individual cell but we will need potentially one callback for each cell unless there are commonalities between the cells so one callback can serve multiple cells. Remember that we still get the row and column as arguments in the callback so we will always know exactly for which cell the callback was made.

To keep the size of this example we will use the table callback method for content and specify the label directly in the cell specification. With this decision made we get the following definition cell specifications

```
hpdf_tbl_cell_spec_t cell_specs[] = {
    { .row=0, .col=0, .rowspan=1, .colspan=3,
      .label="Name:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    { .row=0, .col=3, .rowspan=1, .colspan=1,
      .label="Date:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    { .row=1, .col=0, .rowspan=1, .colspan=4,
      .label="Address:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    { .row=2, .col=0, .rowspan=1, .colspan=3,
      .label="City:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    { .row=2, .col=3, .rowspan=1, .colspan=1,
      .label="Zip:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    { .row=3, .col=0, .rowspan=1, .colspan=4,
      .label="E-mail:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    { .row=4, .col=0, .rowspan=1, .colspan=2,
      .label="Workphone:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    { .row=4, .col=2, .rowspan=1, .colspan=2,
      .label="Mobile:",
      .content_cb=NULL, .label_cb=NULL, .style_cb=NULL, .canvas_cb=NULL},
    HPDF_TBL_END_CELLSPECS // Sentinel to mark the end of
};
```

As can be seen we need to have a end of cell specification sentinel since we could decide to provide details for one or more cells and there is no way for the library to know how many fields to read otherwise. There is even a convenience constant in the library `PDF_TBL_END_CELLSPECS` that can be used as the last record.

The overall table specification is pretty much as before but with the added cell specifications.

```
hpdf_tbl_spec_t tbl_spec = {
    // Title and header flag
    .title=NULL, .use_header=FALSE,
    // Label and labelgrid flags
    .use_labels=TRUE, .use_labelgrid=TRUE,
    // Row and columns
    .rows=5, .cols=4,
    // xpos and ypos
    .xpos=hpdf_tbl_cm2dpi(1), .ypos=hpdf_tbl_cm2dpi(A4PAGE_HEIGHT_CM-2),
    // width and height
    .width=hpdf_tbl_cm2dpi(15), .height=0,
    // Content and label callback
    .content_cb=cb_content, .label_cb=cb_label,
```

```

// Style and table post creation callback
.style_cb=NULL, .post_cb=NULL,
// Pointer to optional cell specifications
.cell_spec=cell_specs
};

```

When this is run (see [tut_ex13_2.c](#)) it generates the following image, **Figure 13.2**

Mark Ericson	12 Sep 2021	123 Downer Mews	London
NW2 HB3	mark.p.ericson@myfinemail.com	+44734 354 184 56	+44771 938 137 11

Figure 16: Specifying a table as data with cell specifications.

What remains is to write the proper table content callback that will populate the table. In a real life scenario his data will most likely come from a database but adding that in our example would bring to far. Instead we will just use some fake static dummy data to illustrate the principle.

Since we have one callback for all cells we need to test from which cell the call come from. Here is a very important point to make. **The row and column number will be the row and cell columns in the original table before any column or row spans was applied.** In this example it means that for example the "Date" field (upper right) will have row=0 and col=3 and **not** (0, 1) !!.

With this information we can write the following (dummy) table callback

```

static char *
cb_content(void *tag, size_t r, size_t c) {
    static char *cell_content[] =
        {"Mark Ericson",
         "12 Sep 2021",
         "123 Downer Mews",
         "London",
         "NW2 HB3",
         "mark.p.ericson@myfinemail.com",
         "+44734 354 184 56",
         "+44771 938 137 11"};
    if( 0==r && 0==c) return cell_content[0];
    else if (0==r && 3==c) return cell_content[1];
    else if (1==r && 0==c) return cell_content[2];
    else if (2==r && 0==c) return cell_content[3];
    else if (2==r && 3==c) return cell_content[4];
    else if (3==r && 0==c) return cell_content[5];
    else if (4==r && 0==c) return cell_content[6];
    else if (4==r && 2==c) return cell_content[7];
    else return NULL;
}

```

and we get the (expected) result as shown in **Figure 17** below.

Mark Ericson	12 Sep 2021	123 Downer Mews	London
NW2 HB3	mark.p.ericson@myfinemail.com	+44734 354 184 56	+44771 938 137 11

Figure 17: Specifying a table as data with cell specifications and "dummy" data.

The alternative of specifying individual callback for each cell would then require that each cell have a callback provided or perhaps even a mix with both a general table callback and selected cell callbacks.

The priority is such that a cell callback will always override a table callback. In the above example the callback for the name field could as an example be

```

static char *
cb_content_name(void *tag, size_t r, size_t c) {
    static char *cell_content = "Mark Ericson";
    return cell_content;
}

```

Chapter 9

Widgets

9.1 Overview

A feature in the library is the possibility to add widgets in table cell. A widget is used to visualize data value in a cell instead of a numeric value. For example a percentage value can instead be represented by a horizontal bar.

As of this writing the library supports the following five widgets.

9.1.1 1. Segmented horizontal bar example

Horizontal discrete (segmented) bar. Number of segment is user defined.

9.1.2 2. Horizontal bar example

Basic horizontal bar

9.1.3 3. Signal strength meter example

A widget indicate a signal strength in similar fashion as the signal strength meter on a phone.

9.1.4 4. Radio sliding button example

Radio button/Slider with different on/off

9.1.5 5. Boxed letters example

Highlight zero or more letters

9.2 Widget functions

All the widgets are used in the same way. They are included as a part of a canvas callback function as installed by the `hpdfdbl_set_canvas_cb()` and `hpdfdbl_set_cell_canvas_cb()` functions. The callback function itself has to follow the canvas callback signature which is defined as

```
typedef void (*hpdfdbl_canvas_callback_t)(HPDF_Doc, HPDF_Page, void *, size_t, size_t, HPDF_REAL, HPDF_REAL,
                                         HPDF_REAL,
```

```
                                         HPDF_REAL);
```

and a typical example of a canvas callback function and its installation would be

```
void
cb_draw_segment_hbar(HPDF_Doc doc, HPDF_Page page, void *tag, size_t r,
                    size_t c, HPDF_REAL xpos, HPDF_REAL ypos,
                    HPDF_REAL width, HPDF_REAL height)
{ ... }
...
hpdfdbl_set_cell_canvas_cb(t, wrow, wcol, cb_draw_segment_hbar);
```

Each widget has its on function that should be included in the canvas callback to display and size the widget. The different widgets have slightly different defining functions depending on what they display and are defined as follows.

9.2.1 Segmented horizontal bar defining function

```
void
hpdfdbl_widget_segment_hbar(const HPDF_Doc doc, const HPDF_Page page,
                           const HPDF_REAL xpos, const HPDF_REAL ypos, const HPDF_REAL width, const
                           HPDF_REAL height,
                           const size_t num_segments, const HPDF_RGBColor on_color, const double
                           val_percent,
                           const _Bool hide_val)
```

9.2.2 Horizontal bar defining function

```
void
hpdfdbl_widget_hbar(const HPDF_Doc doc, const HPDF_Page page,
                   const HPDF_REAL xpos, const HPDF_REAL ypos, const HPDF_REAL width, const HPDF_REAL
                   height,
                   const HPDF_RGBColor color, const float val, const _Bool hide_val)
```

9.2.3 Signal strength defining function

```
void
hpdftbl_widget_strength_meter(const HPDF_Doc doc, const HPDF_Page page,
                             const HPDF_REAL xpos, const HPDF_REAL ypos, const HPDF_REAL width, const
                             HPDF_REAL height,
                             const size_t num_segments, const HPDF_RGBColor on_color, const size_t
                             num_on_segments)
```

9.2.4 Radio sliding button defining function

```
void
hpdftbl_widget_slide_button(HPDF_Doc doc, HPDF_Page page,
                             HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, _Bool state)
```

9.2.5 Boxed letters defining function

```
void
hpdftbl_table_widget_letter_buttons(HPDF_Doc doc, HPDF_Page page,
                                     HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height,
                                     const HPDF_RGBColor on_color, const HPDF_RGBColor off_color,
                                     const HPDF_RGBColor on_background, const HPDF_RGBColor off_background,
                                     const HPDF_REAL fsize,
                                     const char *letters, _Bool *state)
```

9.3 Usage

The widget function is included in either a table canvas callback or more commonly in a cell canvas callback. Let's construct a basic example with a 1x2 table that shows a segmented horizontal bar indicating a fictive battery charge level and signal strength meter as shown in the figure below

Figure 9.1 tut_ex14.c

For this we start by constructing the callback for the battery display. In a real application the value would probably be read from a database but here we just use a hard coded value

```
cb_draw_battery_widget(HPDF_Doc doc, HPDF_Page page, void *tag, size_t r,
                      size_t c, HPDF_REAL xpos, HPDF_REAL ypos,
                      HPDF_REAL width, HPDF_REAL height) {
    const HPDF_REAL segment_tot_width = width * 0.5;
    const HPDF_REAL segment_height = height / 3;
    const HPDF_REAL segment_xpos = xpos + 40;
    const HPDF_REAL segment_ypos = ypos + 4;
    const size_t num_segments = 10;
    const _Bool val_text_hide = FALSE; // Display the percentage
    const HPDF_RGBColor on_color = HPDF_COLOR_DARK_GREEN;

    // This should in reality be retrieved programmatically (for example from a DB)
    const double val_percent = 0.4;

    hpdftbl_widget_segment_hbar(
        doc, page, segment_xpos, segment_ypos, segment_tot_width,
        segment_height, num_segments, on_color, val_percent, val_text_hide);
}
```

Some comments:

- In the callback we get the bounding box for the cell as arguments

- We adjust the position and height/width so that the widget is centered in the cell

The next callback is the signal strength widget and we construct that as follows

```
void
cb_draw_signal_widget(HPDF_Doc doc, HPDF_Page page, void *tag, size_t r,
                      size_t c, HPDF_REAL xpos, HPDF_REAL ypos,
                      HPDF_REAL width, HPDF_REAL height) {
    const HPDF_REAL wwidth = 35;
    const HPDF_REAL wheight = 20;
    const HPDF_REAL wxpos = xpos + 70;
    const HPDF_REAL wypos = ypos + 4;
    const size_t num_segments = 5;
    const HPDF_RGBColor on_color = HPDF_COLOR_DARK_RED;
    // This should in reality be retrieved programmatically (for example from a DB)
    const size_t num_on_segments = 3;
    hpdftbl_widget_strength_meter(doc, page, wxpos, wypos, wwidth, wheight,
                                  num_segments, on_color, num_on_segments);
}
```

Some comments:

- In the callback we get the bounding box for the cell as arguments
- We adjust the position and height/width so that the widget is centered in the cell

With these callbacks it is now straightforward to construct the table with as follows

```
void
create_table_ex14(HPDF_Doc pdf_doc, HPDF_Page pdf_page) {
    const size_t num_rows = 2;
    const size_t num_cols = 2;
    char *table_title = "tut_ex14: 2x2 table widget callbacks";
    hpdftbl_t tbl = hpdftbl_create_title(num_rows, num_cols, table_title);
    hpdftbl_use_labels(tbl, TRUE);
    hpdftbl_use_labelgrid(tbl, TRUE);
    // Use one label callback for the entire table
    hpdftbl_set_label_cb(tbl, cb_labels);
    // Name in top left corner
    hpdftbl_set_cell_content_cb(tbl, 0, 0, cb_device_name);
    // Date in top right corner
    hpdftbl_set_cell_content_cb(tbl, 0, 1, cb_date);
    // Draw battery strength
    hpdftbl_set_cell_canvas_cb(tbl, 1, 0, cb_draw_battery_widget);
    // Draw signal strength
    hpdftbl_set_cell_canvas_cb(tbl, 1, 1, cb_draw_signal_widget);
    HPDF_REAL xpos = hpdftbl_cm2dpi(1);
    HPDF_REAL ypos = hpdftbl_cm2dpi(A4PAGE_HEIGHT_CM - 1);
    HPDF_REAL width = hpdftbl_cm2dpi(12);
    HPDF_REAL height = 0; // Calculate height automatically
    // Stroke the table to the page
    hpdftbl_stroke(pdf_doc, pdf_page, tbl, xpos, ypos, width, height);
}
```

Some comments:

- For brevity, we have not shown the label and other content callback.
- The complete code is available as [tut_ex14.c](#)

Chapter 10

HPDFTBL API Overview

10.1 Table creation related functions

These calls relate to the creation, destruction and stroking of the table on the PDF page.

- [hpdftbl_create\(\)](#) *Create a handle for a new table.*
- [hpdftbl_create_title\(\)](#) *Create a handle for a new with a title.*
- [hpdftbl_destroy\(\)](#) *Destroy (return) memory used by a table.*
- [hpdftbl_stroke\(\)](#) *Stroke a table on the specified PDF page.*
- [hpdftbl_stroke_from_data\(\)](#) *Construct and stroke a table defined as a data structure.*
- [hpdftbl_get_last_auto_height\(\)](#) *Get the height of the last table stroked.*
- [hpdftbl_set_anchor_top_left\(\)](#) *Switch the anchor point of a table between top left and bottom left corner.*
- [hpdftbl_get_anchor_top_left\(\)](#) *Get the current anchor point of table.*

10.2 Table error handling

- [hpdftbl_set_errhandler\(\)](#) *Set an error handler callback.*
- [hpdftbl_get_errstr\(\)](#) *Translate an error code into a human readable string.*
- [hpdftbl_get_last_errcode\(\)](#) *Get the error code from last error raised*
- [hpdftbl_default_table_error_handler\(\)](#) *A default error handler callback that print error to stdout and quits the process.*

10.3 Theme handling methods

Themes is a technique to easier specify the look and feel to be re-used for multiple tables.

- [hpdftbl_apply_theme\(\)](#) *Use the specified theme for look & feel of table*
- [hpdftbl_get_default_theme\(\)](#) *Get the default theme. A good way to start and then modify.*
- [hpdftbl_destroy_theme\(\)](#) *Free all memory structures used by a theme.*

10.4 Table layout adjusting functions

Adjusting the structure of the table (apart from number of rows and columns)

- `hpdtbl_set_colwidth_percent()` *Set the column width as a percentage of the entire table width.*
- `hpdtbl_set_min_rowheight()` *Specify the minimum row height in points*
- `hpdtbl_set_bottom_vmargin_bottom()` *Specify the bottom margin for content as a fraction of the specified fontsize*
- `hpdtbl_set_cellspan()` **Define a cell to span multiple rows and columns.**
- `hpdtbl_clear_spanning()` *Remove all previous set cell spanning.*

10.5 Table style modifying functions

These function are all about look an feel of the table.

- `hpdtbl_use_labels()` *Use labels in each cell.*
- `hpdtbl_use_labelgrid()` *Use shorter left gridlines that only goes down and cover labels*
- `hpdtbl_set_background()` *Set cell background color.*
- `hpdtbl_set_outer_grid_style()` *Set style of the table outer grid lines.*
- `hpdtbl_set_inner_grid_style()` *Set the style of both vertical and horizontal inner grid lines.*
- `hpdtbl_set_inner_vgrid_style()` *Set the style of table inner vertical grid lines.*
- `hpdtbl_set_inner_hgrid_style()` *Set the style of table inner horizontal grid lines.*
- `hpdtbl_set_header_style()` *Set the style for the table header row.*
- `hpdtbl_set_header_halign()` *Set the horizontal alignment of the header row.*
- `hpdtbl_set_title_halign()` *Set horizontal alignment for title.*
- `hpdtbl_use_header()` *Make the top row a header.*
- `hpdtbl_set_label_style()` *Set style for cell labels.*
- `hpdtbl_set_row_content_style()` *Set the content style for an entire row.*
- `hpdtbl_set_col_content_style()` *Set the content style for an entire column.*
- `hpdtbl_set_content_style()` *Set the content style for the entire table.*
- `hpdtbl_set_cell_content_style()` *Set the stle for specified cell. This overrides andy style on the table level.*
- `hpdtbl_set_title_style()` *Set the style for the table title.*

10.6 Content handling

Content in a table can be specified in three ways

1. Manually for each cell by calling the `hpdftbl_set_cell()` function
 2. In one go by creating a 1D data array for all cell
 3. Creating a callback which returns the wanted value
- `hpdftbl_set_cell()` Set content text in specified cell.
 - `hpdftbl_set_tag()` Set the table tag. The tag is a `void *` and can be anything. The tag is the first parameter of all callbacks.
 - `hpdftbl_set_title()` Set title text of table.
 - `hpdftbl_set_labels()` Set label texts for the table from 1D-data array.
 - `hpdftbl_set_content()` Set the content text for the entire table from a 1D-data array.

10.7 Callback handling

Callbacks can be specified on both table but also on cell level. The simple rule is that if a cell has a callback that is used, otherwise the table callback is used.

- `hpdftbl_set_content_cb()` Set table content callback.
- `hpdftbl_set_cell_content_cb()` Set cell content callback.
- `hpdftbl_set_cell_content_style_cb()` Set the cell style callback.
- `hpdftbl_set_content_style_cb()` Set the table style callback.
- `hpdftbl_set_label_cb()` Set table label callback.
- `hpdftbl_set_cell_label_cb()` Set the cell label callback.
- `hpdftbl_set_canvas_cb()` Set table canvas callback.
- `hpdftbl_set_cell_canvas_cb()` Set the cell canvas callback.

10.8 Text encoding

- `hpdftbl_set_text_encoding()` Specify text encodation to use.
- `hpdftbl_encoding_text_out()` Stroke a text with current encoding.

10.9 Misc utility function

- `HPDF_RoundedCornerRectangle()` Draw a rectangle with rounded corners.
- `hpdftbl_stroke_grid()` *Stroke a grid on the PDF page (entire page). This is useful to position the table on a page. The grid is measured in points i.e. postscript natural units.

Data Structure Index

12.1 Data Structures

Here are the data structures with brief descriptions:

grid_style	Specification for table grid lines	51
hpdftbl	Core table handle	52
hpdftbl_cell	Specification of individual cells in the table	59
hpdftbl_cell_spec	Used in data driven table creation	63
hpdftbl_errcode_entry	An entry in the error string table	65
hpdftbl_spec	Used in data driven table creation	66
hpdftbl_theme	Define a set of styles into a table theme	70
line_dash_style	Definition of a dashed line style	74
text_style	Specification of a text style	74

Chapter 13

File Index

13.1 File List

Here is a list of all documented files with brief descriptions:

/Users/ljp/Devel/hpdf_table/scripts/ bootstrap.sh	
Bootstrap the autotools environment and configure a build setup	77
/Users/ljp/Devel/hpdf_table/scripts/ dbgblld.sh	
Setup a build environment for debugging	77
/Users/ljp/Devel/hpdf_table/scripts/ docupload.sh.in	
Upload the generated documentation to the github pages doc site for the author	78
/Users/ljp/Devel/hpdf_table/scripts/ stdbld.sh	
Setup a build environment for production build	79
/Users/ljp/Devel/hpdf_table/src/ config.h	80
/Users/ljp/Devel/hpdf_table/src/ hpdftbl.c	
Main module for flexible table drawing with HPDF library	81
/Users/ljp/Devel/hpdf_table/src/ hpdftbl.h	
Header file for libhpdftbl	116
/Users/ljp/Devel/hpdf_table/src/ hpdftbl_errstr.c	
Utility module to translate HPDF error codes to human readable strings	169
/Users/ljp/Devel/hpdf_table/src/ hpdftbl_grid.c	
Create a grid on a document for positioning	170
/Users/ljp/Devel/hpdf_table/src/ hpdftbl_theme.c	
Functions for theme handling	170

14.2.2 Field Documentation

14.2.2.1 bottom_vmargin_factor

`HPDF_REAL bottom_vmargin_factor`

The content text bottom margin as a factor of the fontsize

Referenced by [hpdftbl_create_title\(\)](#), and [hpdftbl_set_bottom_vmargin_bottom\(\)](#).

14.2.2.2 canvas_cb

[hpdftbl_canvas_callback_t](#) canvas_cb

Table canvas callback. Will be called for each cell unless the cell has its own canvas callback

Referenced by [hpdftbl_set_canvas_cb\(\)](#).

14.2.2.3 cells

`hpdftbl_cell_t* cells`

Reference to all an array of cells in the table

Referenced by [hpdftbl_clear_spanning\(\)](#), [hpdftbl_create_title\(\)](#), [hpdftbl_set_content\(\)](#), and [hpdftbl_set_labels\(\)](#).

14.2.2.4 col_width_percent

`float* col_width_percent`

User specified column width array as fraction of the table width. Defaults to equ-width

Referenced by [hpdftbl_create_title\(\)](#), and [hpdftbl_set_colwidth_percent\(\)](#).

14.2.2.5 cols

`size_t cols`

Number of columns in table

Referenced by [hpdftbl_clear_spanning\(\)](#), [hpdftbl_create_title\(\)](#), [hpdftbl_destroy\(\)](#), [hpdftbl_set_colwidth_percent\(\)](#), [hpdftbl_set_content\(\)](#), [hpdftbl_set_labels\(\)](#), and [hpdftbl_set_row_content_style\(\)](#).

14.2.2.6 content_cb

`hpdftbl_content_callback_t content_cb`

Table content callback. Will be called for each cell unless the cell has its own content callback

Referenced by [hpdftbl_set_content_cb\(\)](#).

14.2.2.7 content_style

`hpdf_text_style_t content_style`

Content style

Referenced by [hpdftbl_set_background\(\)](#), and [hpdftbl_set_content_style\(\)](#).

14.2.2.8 content_style_cb

`hpdftbl_content_style_callback_t` content_style_cb

Style for content callback. Will be called for each cell unless the cell has its own content style callback

Referenced by [hpdftbl_set_content_style_cb\(\)](#).

14.2.2.9 header_style

`hpdf_text_style_t` header_style

Header style

Referenced by [hpdftbl_set_header_halign\(\)](#), and [hpdftbl_set_header_style\(\)](#).

14.2.2.10 height

`HPDF_REAL` height

Table height. If specified as 0 then the height will be automatically calculated

14.2.2.11 inner_hgrid

`hpdftbl_grid_style_t` inner_hgrid

Table inner horizontal border settings, if width>0 this takes precedence over the generic inner border

Referenced by [hpdftbl_set_inner_hgrid_style\(\)](#).

14.2.2.12 inner_tgrid

`hpdftbl_grid_style_t` inner_tgrid

Table inner horizontal top border settings, if width>0 this takes precedence over the generic horizontal and inner horizontal border

Referenced by [hpdftbl_set_inner_tgrid_style\(\)](#).

14.2.2.13 inner_vgrid

`hpdftbl_grid_style_t` inner_vgrid

Table inner vertical border settings, if width>0 this takes precedence over the generic inner border

Referenced by [hpdftbl_set_inner_vgrid_style\(\)](#).

14.2.2.14 label_cb

`hpdftbl_content_callback_t` label_cb

Table content callback. Will be called for each cell unless the cell has its own content callback

Referenced by [hpdftbl_set_label_cb\(\)](#).

14.2.2.15 label_style

`hpdf_text_style_t` label_style

Label style settings

Referenced by [hpdftbl_set_label_style\(\)](#).

14.2.2.16 minheight

`HPDF_REAL` minheight

Minimum table height. If specified as 0 it has no effect

Referenced by [hpdftbl_set_min_rowheight\(\)](#).

14.2.2.17 outer_grid

`hpdftbl_grid_style_t` outer_grid

Table outer border settings

Referenced by [hpdftbl_set_outer_grid_style\(\)](#).

14.2.2.18 pdf_doc

HPDF_Doc pdf_doc

PDF document references

14.2.2.19 pdf_page

HPDF_Page pdf_page

PDF page reference

Referenced by [hpdftbl_set_line_dash\(\)](#).

14.2.2.20 posx

HPDF_REAL posx

X-position of table. Reference point defaults to lower left but can be changed by calling [hpdftbl_set_anchor_top_left\(\)](#)

14.2.2.21 posy

HPDF_REAL posy

Y-position of table. Reference point defaults to lower left but can be changed by calling [hpdftbl_set_anchor_top_left\(\)](#)

14.2.2.22 rows

size_t rows

Number of rows in table

Referenced by [hpdftbl_clear_spanning\(\)](#), [hpdftbl_create_title\(\)](#), [hpdftbl_destroy\(\)](#), [hpdftbl_set_col_content_style\(\)](#), [hpdftbl_set_content\(\)](#), and [hpdftbl_set_labels\(\)](#).

14.2.2.23 tag

void* tag

Optional tag used in callbacks. This can be used to identify the table or add any reference needed by a particular application

Referenced by [hpdftbl_set_tag\(\)](#).

14.2.2.24 title_style

`hpdf_text_style_t title_style`

Title style

Referenced by [hpdftbl_set_title_halign\(\)](#), and [hpdftbl_set_title_style\(\)](#).

14.2.2.25 title_txt

`char* title_txt`

Title text

Referenced by [hpdftbl_create_title\(\)](#), [hpdftbl_destroy\(\)](#), and [hpdftbl_set_title\(\)](#).

14.2.2.26 use_cell_labels

`_Bool use_cell_labels`

Flag to determine if cell labels should be used

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_use_labels\(\)](#).

14.2.2.27 use_header_row

`_Bool use_header_row`

Flag to determine if the first row in the table should be formatted as a header row

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_use_header\(\)](#).

14.2.2.28 use_label_grid_style

`_Bool use_label_grid_style`

Flag to determine if the short vertical label border should be used. Default is to use half grid.

Referenced by [hpdftbl_apply_theme\(\)](#), [hpdftbl_use_labelgrid\(\)](#), and [hpdftbl_use_labels\(\)](#).

14.2.2.29 use_zebra

`_Bool use_zebra`

Use alternating background color on every second line TRUE or FALSE. Defaults to FALSE.

14.2.2.30 width

`HPDF_REAL width`

Table width

14.2.2.31 zebra1_color

`HPDF_RGBColor zebra1_color`

First zebra color.

See also

[use_zebra](#)

14.2.2.32 zebra2_color

`HPDF_RGBColor zebra2_color`

Second zebra color.

See also

[use_zebra](#)

- struct [hpdftbl_cell](#) * [parent_cell](#)

14.3.1 Detailed Description

Specification of individual cells in the table.

This structure contains all information pertaining to each cell in the table. The position of the cell is given as relative position from the lower left corner of the table.

14.3.2 Field Documentation

14.3.2.1 [canvas_cb](#)

[hpdftbl_canvas_callback_t](#) [canvas_cb](#)

Canvas callback. If this is specified then this will override any canvas callback specified for the table

14.3.2.2 [colspan](#)

size_t [colspan](#)

Number of column this cell spans

Referenced by [hpdftbl_clear_spanning\(\)](#).

14.3.2.3 content

`char* content`

String reference for cell content

Referenced by [hpdftbl_set_content\(\)](#).

14.3.2.4 content_cb

[hpdftbl_content_callback_t](#) content_cb

Content callback. If this is specified then this will override any content callback specified for the table

14.3.2.5 content_style

[hpdf_text_style_t](#) content_style

The style of the text content. If a style callback is specified the callback will override this setting

14.3.2.6 delta_x

`HPDF_REAL delta_x`

X-Position of cell from bottom left of table

14.3.2.7 delta_y

`HPDF_REAL delta_y`

Y-Position of cell from bottom left of table

14.3.2.8 height

`HPDF_REAL height`

Height of cell

14.3.2.9 label

`char* label`

String reference for label text

Referenced by [hpdftbl_set_labels\(\)](#).

14.3.2.10 label_cb

`hpdftbl_content_callback_t` label_cb

Label callback. If this is specified then this will override any content callback specified for the table

14.3.2.11 parent_cell

`struct hpdftbl_cell*` parent_cell

Parent cell. If this cell is part of another cells row or column spanning this is a reference to this parent cell. Normal cells without spanning has NULL as parent cell.

Referenced by [hpdftbl_clear_spanning\(\)](#).

14.3.2.12 rowspan

`size_t` rowspan

Number of rows this cell spans

Referenced by [hpdftbl_clear_spanning\(\)](#).

14.3.2.13 style_cb

`hpdftbl_content_style_callback_t` style_cb

Style for content callback. If this is specified then this will override any style content callback specified for the table

14.3.2.14 textwidth

`HPDF_REAL` textwidth

Width of content string

14.3.2.15 width

`HPDF_REAL` width

Width of cells

The documentation for this struct was generated from the following file:

- [/Users/ljp/Devel/hpdf_table/src/hpdftbl.h](#)

14.4 hpdfdbl_cell_spec Struct Reference

Used in data driven table creation.

```
#include <hpdfdbl.h>
```

Data Fields

- `size_t row`
- `size_t col`
- `unsigned rowspan`
- `unsigned colspan`
- `char * label`
- `hpdfdbl_content_callback_t content_cb`
- `hpdfdbl_content_callback_t label_cb`
- `hpdfdbl_content_style_callback_t style_cb`
- `hpdfdbl_canvas_callback_t canvas_cb`

14.4.1 Detailed Description

Used in data driven table creation.

A table can be specified by creating a array of this structure together with the `hpdfdbl_spec_t` structure. The array should have one entry for each cell in the table.

See also

[hpdfdbl_stroke_from_data\(\)](#)

Examples

[example01.c](#), and [tut_ex13_2.c](#).

14.4.2 Field Documentation

14.4.2.1 canvas_cb

`hpdfdbl_canvas_callback_t canvas_cb`

Canvas callback for this cell

Referenced by [hpdfdbl_stroke_from_data\(\)](#).

14.4.2.2 col

`size_t col`

Row for specified cell

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.4.2.3 colspan

`unsigned colspan`

Number of columns the specified cell should span

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.4.2.4 content_cb

[hpdftbl_content_callback_t](#) `content_cb`

Content callback for this cell

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.4.2.5 label

`char* label`

The label for this cell

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.4.2.6 label_cb

[hpdftbl_content_callback_t](#) `label_cb`

Label callback for this cell

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.4.2.7 `row`

`size_t row`

Row for specified cell

Examples

[tut_ex13_2.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.4.2.8 `rowspan`

`unsigned rowspan`

Number of rows the specified cell should span

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.4.2.9 `style_cb`

[hpdftbl_content_style_callback_t](#) `style_cb`

Content style callback for this cell

Referenced by [hpdftbl_stroke_from_data\(\)](#).

The documentation for this struct was generated from the following file:

- `/Users/ljp/Devel/hpdf_table/src/hpdftbl.h`

14.5 `hpdftbl_errcode_entry` Struct Reference

An entry in the error string table.

Data Fields

- `char * errstr`
- `unsigned errcode`

14.5.1 Detailed Description

An entry in the error string table.

14.5.2 Field Documentation

14.5.2.1 `errcode`

```
unsigned errcode
```

The error code from HPDF library

14.5.2.2 `errstr`

```
char* errstr
```

Pointer to the error string

The documentation for this struct was generated from the following file:

- `/Users/ljp/Devel/hpdf_table/src/hpdftbl_errstr.c`

14.6 `hpdftbl_spec` Struct Reference

Used in data driven table creation.

```
#include <hpdftbl.h>
```

Data Fields

- `char * title`
- `_Bool use_header`
- `_Bool use_labels`
- `_Bool use_labelgrid`
- `size_t rows`
- `size_t cols`
- `HPDF_REAL xpos`
- `HPDF_REAL ypos`
- `HPDF_REAL width`
- `HPDF_REAL height`
- `hpdftbl_content_callback_t content_cb`
- `hpdftbl_content_callback_t label_cb`
- `hpdftbl_content_style_callback_t style_cb`
- `hpdftbl_callback_t post_cb`
- `hpdftbl_cell_spec_t * cell_spec`

14.6.1 Detailed Description

Used in data driven table creation.

This is used together with an array of cell specification `hpdfctl_cell_spec_t` to specify the layout of a table.

Examples

[example01.c](#), [tut_ex13_1.c](#), and [tut_ex13_2.c](#).

14.6.2 Field Documentation

14.6.2.1 cell_spec

`hpdfctl_cell_spec_t* cell_spec`

Array of cell specification

Referenced by [hpdfctl_stroke_from_data\(\)](#).

14.6.2.2 cols

`size_t cols`

Number of columns in the table

Referenced by [hpdfctl_stroke_from_data\(\)](#).

14.6.2.3 content_cb

`hpdfctl_content_callback_t content_cb`

Content callback for this table

Referenced by [hpdfctl_stroke_from_data\(\)](#).

14.6.2.4 height

`HPDF_REAL height`

Height of table

Referenced by [hpdfctl_stroke_from_data\(\)](#).

14.6.2.5 label_cb

`hpdftbl_content_callback_t label_cb`

Label callback for this table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.6 post_cb

`hpdftbl_callback_t post_cb`

Post table creation callback. This is an opportunity for a client to do any special table manipulation before the table is stroked to the page. A reference to the table will be passed on in the callback.

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.7 rows

`size_t rows`

Number of rows in the table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.8 style_cb

`hpdftbl_content_style_callback_t style_cb`

Content style callback for table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.9 title

`char* title`

Table title

Examples

[example01.c](#), [tut_ex13_1.c](#), and [tut_ex13_2.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.10 use_header

`_Bool use_header`

Use a header for the table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.11 use_labelgrid

`_Bool use_labelgrid`

Use label grid in table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.12 use_labels

`_Bool use_labels`

Use labels in table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.13 width

`HPDF_REAL width`

Width of table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.14 xpos

`HPDF_REAL xpos`

X-position for table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

14.6.2.15 ypos

HPDF_REAL ypos

Y-position for table

Referenced by [hpdftbl_stroke_from_data\(\)](#).

The documentation for this struct was generated from the following file:

- [/Users/ljp/Devel/hpdf_table/src/hpdftbl.h](#)

14.7 hpdftbl_theme Struct Reference

Define a set of styles into a table theme.

```
#include <hpdftbl.h>
```

Data Fields

- [hpdf_text_style_t content_style](#)
- [hpdf_text_style_t label_style](#)
- [hpdf_text_style_t header_style](#)
- [hpdf_text_style_t title_style](#)
- [hpdftbl_grid_style_t outer_border](#)
- [_Bool use_labels](#)
- [_Bool use_label_grid_style](#)
- [_Bool use_header_row](#)
- [hpdftbl_grid_style_t inner_vborder](#)
- [hpdftbl_grid_style_t inner_hborder](#)
- [hpdftbl_grid_style_t inner_tborder](#)
- [_Bool use_zebra](#)
- HPDF_RGBColor [zebra1_color](#)
- HPDF_RGBColor [zebra2_color](#)

14.7.1 Detailed Description

Define a set of styles into a table theme.

Contains all information about the styles of various elements in the table that together make up the table style

Examples

[example01.c](#).

14.7.2 Field Documentation

14.7.2.1 content_style

`hpdf_text_style_t` content_style

Content text style

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.2 header_style

`hpdf_text_style_t` header_style

Header text style

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.3 inner_hborder

`hpdftbl_grid_style_t` inner_hborder

Table inner horizontal border settings, if width>0 this takes precedence over the generic inner border

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.4 inner_tborder

`hpdftbl_grid_style_t` inner_tborder

Table inner horizontal top border settings, if width>0 this takes precedence over the generic horizontal and inner horizontal border

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.5 inner_vborder

`hpdftbl_grid_style_t` inner_vborder

Table inner vertical border settings, if width>0 this takes precedence over the generic inner border

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.6 label_style

`hpdf_text_style_t label_style`

Label text style

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.7 outer_border

`hpdftbl_grid_style_t outer_border`

Table outer border style

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.8 title_style

`hpdf_text_style_t title_style`

Table title text style

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.9 use_header_row

`_Bool use_header_row`

Flag if header row should be used

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.10 use_label_grid_style

`_Bool use_label_grid_style`

Flag if the special short vertical grid style for labels should be used

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.11 use_labels

`_Bool use_labels`

Flag if cell labels should be used

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_get_default_theme\(\)](#).

14.7.2.12 use_zebra

`_Bool use_zebra`

Use alternating background color on every second line TRUE or FALSE. Defaults to FALSE.

Referenced by [hpdftbl_get_default_theme\(\)](#).

14.7.2.13 zebra1_color

`HPDF_RGBColor zebra1_color`

First zebra color.

See also

[use_zebra](#)

Referenced by [hpdftbl_get_default_theme\(\)](#).

14.7.2.14 zebra2_color

`HPDF_RGBColor zebra2_color`

Second zebra color.

See also

[use_zebra](#)

Referenced by [hpdftbl_get_default_theme\(\)](#).

The documentation for this struct was generated from the following file:

- [/Users/ljp/Devel/hpdf_table/src/hpdftbl.h](#)

14.8 line_dash_style Struct Reference

Definition of a dashed line style.

Data Fields

- HPDF_UINT16 [dash_ptn](#) [8]
- [size_t](#) [num](#)

14.8.1 Detailed Description

Definition of a dashed line style.

14.8.2 Field Documentation

14.8.2.1 dash_ptn

```
HPDF_UINT16 dash_ptn[8]
```

HPDF dash line definition

14.8.2.2 num

```
size_t num
```

Number of segments in the dashed line

The documentation for this struct was generated from the following file:

- [/Users/ljp/Devel/hpdf_table/src/hpdftbl.c](#)

14.9 text_style Struct Reference

Specification of a text style.

```
#include <hpdftbl.h>
```

Data Fields

- [char *](#) [font](#)
- HPDF_REAL [fsize](#)
- HPDF_RGBColor [color](#)
- HPDF_RGBColor [background](#)
- [hpdftbl_text_align_t](#) [halign](#)

14.9.1 Detailed Description

Specification of a text style.

This structure collects the basic properties for a text string (font, color, background, horizontal alignment)

Examples

[tut_ex09.c](#).

14.9.2 Field Documentation

14.9.2.1 background

HPDF_RGBColor background

Font background color

Examples

[tut_ex09.c](#).

Referenced by [hpdtbl_apply_theme\(\)](#), [hpdtbl_set_background\(\)](#), [hpdtbl_set_content_style\(\)](#), [hpdtbl_set_header_style\(\)](#), [hpdtbl_set_label_style\(\)](#), and [hpdtbl_set_title_style\(\)](#).

14.9.2.2 color

HPDF_RGBColor color

Font color

Examples

[tut_ex09.c](#).

Referenced by [hpdtbl_apply_theme\(\)](#), [hpdtbl_set_content_style\(\)](#), [hpdtbl_set_header_style\(\)](#), [hpdtbl_set_label_style\(\)](#), and [hpdtbl_set_title_style\(\)](#).

14.9.2.3 font

`char* font`

Font face name

Examples

[tut_ex09.c](#).

Referenced by [hpdtbl_apply_theme\(\)](#), [hpdtbl_set_content_style\(\)](#), [hpdtbl_set_header_style\(\)](#), [hpdtbl_set_label_style\(\)](#), and [hpdtbl_set_title_style\(\)](#).

14.9.2.4 fsize

`HPDF_REAL fsize`

Font size

Examples

[tut_ex09.c](#).

Referenced by [hpdtbl_apply_theme\(\)](#), [hpdtbl_set_content_style\(\)](#), [hpdtbl_set_header_style\(\)](#), [hpdtbl_set_label_style\(\)](#), and [hpdtbl_set_title_style\(\)](#).

14.9.2.5 halign

`hpdtbl_text_align_t halign`

Text horizontal alignment

Examples

[tut_ex09.c](#).

Referenced by [hpdtbl_apply_theme\(\)](#), [hpdtbl_set_header_halign\(\)](#), and [hpdtbl_set_title_halign\(\)](#).

The documentation for this struct was generated from the following file:

- [/Users/ljp/Devel/hpdf_table/src/hpdtbl.h](#)

Chapter 15

File Documentation

15.1 /Users/ljp/Devel/hpdf_table/scripts/bootstrap.sh File Reference

Bootstrap the autotools environment and configure a build setup.

Variables

- String **ORIG_DIR** = "\${PWD}"
The original directory from where this script is run.

15.1.1 Detailed Description

Bootstrap the autotools environment and configure a build setup.

Note

This must be run when the source have been obtained by cloning the repo and requires a full installation of GNU autotools as a pre-requisite.

Usage:

`bootstrap.sh` [-q] [-h]

-c : Clean **all** generated files. This is equivalent with cloning from the repo.

-q : Quiet

-h : Print help and exit

See LICENSE file. (C) 2022 Johan Persson johan162@gmail.com

15.2 /Users/ljp/Devel/hpdf_table/scripts/dbgbld.sh File Reference

Setup a build environment for debugging.

Variables

- String **ORIG_DIR** = "\${PWD}"
The original directory from where this script is run.

15.2.1 Detailed Description

Setup a build environment for debugging.

In order for easy debugging this means that the debug configuration will only build static library in order to be able to include it in the binaries (e.g. the example programs). With dynamic libraries not yet installed the libtools will build wrapper shell scripts which cannot be debugged.

Usage:

`dbgbld.sh [-q] [-h]`

-q : Quiet
-h : Print help and exit

See LICENSE file. (C) 2022 Johan Persson johan162@gmail.com

15.3 /Users/ljp/Devel/hpdf_table/scripts/docupload.sh.in File Reference

Upload the generated documentation to the github pages doc site for the author.

Variables

- String **GITHUB_USER** = "johan162"
Specifies the user for github.
- String **PACKAGE_NAME** = "@PACKAGE_NAME@"
Specifies the package name. Used to construct the PDF name for the manual.
- String **VERSION** = "@VERSION@"
Defines the version number.
- String **DOCVERSION** = "v\${VERSION}"
The variant of the version number used for documentation.
- String **PDFNAME** = "\${PACKAGE_NAME}-\${VERSION}.pdf"
The full PDF name.
- String **COMMIT_MESSAGE** = "Documentation update for \${PACKAGE_NAME} \${DOCVERSION}"
The git commit message for the doc update.
- String **GITHUB_PAGES_URL** = "git@github.com:\${GITHUB_USER}/\${GITHUB_USER}.github.io.git"
The full URL for the github pages.
- String **GITHUB_PAGES_REPO** = "\${GITHUB_USER}.github.io"
The repo that corresponds to these pages.
- String **HTMLDIR_COPY** = "/docs/out/html"
The directory of HTML files to copy to the github pages.
- String **PDFFILE_COPY** = "/docs/out/latex/refman.pdf"
The PDF file to copy to the github pages.
- String **ORIG_DIR** = "\${PWD}"
The original directory from where this script is run.

15.3.1 Detailed Description

Upload the generated documentation to the github pages doc site for the author.

Note

This file is used to generate the actual runnable script via autoconf (e.g. AC_OUTPUT) as part of the configuration.

Usage:

docupload.sh [-q] [-h]

-q : Quiet

-h : Print help and exit

See LICENSE file. (C) 2022 Johan Persson johan162@gmail.com

15.3.2 Variable Documentation

15.3.2.1 GITHUB_USER

```
String GITHUB_USER = "johan162"
```

Specifies the user for github.

This user name dictates the path to the repo as well as the github pages site. The default value here `johan162` corresponds to the authors github account and as such this script will not work without modification for anyone else since the github repos do not have world write permissions.

15.3.2.2 PDFFILE_COPY

```
String PDFFILE_COPY = "/docs/out/latex/refman.pdf"
```

The PDF file to copy to the github pages.

Note that the name is fixed by Doxygen to `refman.pdf` and is renamed to `PDFNAME` in the copying process.

15.4 /Users/ljp/Devel/hpdf_table/scripts/stdbld.sh File Reference

Setup a build environment for production build.

Variables

- String **ORIG_DIR** = "\${PWD}"

The original directory from where this script is run.

15.4.1 Detailed Description

Setup a build environment for production build.

Usage:

`stdbld.sh [-q] [-h]`

`-q` : Quiet

`-h` : Print help and exit

See LICENSE file. (C) 2022 Johan Persson johan162@gmail.com

Error code for unknown error.

Typedefs

- typedef struct [line_dash_style](#) **line_dash_style_t**
Definition of a dashed line style.

Functions

- `int hpdftbl_set_line_dash (hpdftbl_t t, hpdftbl_line_dashstyle_t style)`
Internal helper to set the line style.
- `void hpdftbl_set_anchor_top_left (const _Bool anchor)`
Switch stroking anchor point.
- `_Bool hpdftbl_get_anchor_top_left (void)`
Get stroking anchor point.
- `const char * hpdftbl_get_errstr (int err)`
Translate a table error code to a human readable string.
- `void hpdftbl_default_table_error_handler (hpdftbl_t t, int r, int c, int err)`
A basic default table error handler.
- `int hpdftbl_get_last_errcode (const char **errstr, int *row, int *col)`
Return last error code.
- `hpdftbl_error_handler_t hpdftbl_set_errhandler (hpdftbl_error_handler_t err_handler)`
Specify errhandler for the table routines.
- `void hpdftbl_set_text_encoding (char *target, char *source)`
Determine text source encoding.
- `int hpdftbl_encoding_text_out (HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, char *text)`
Stroke text with current encoding.
- `void HPDF_RoundedCornerRectangle (HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, HPDF_REAL rad)`
Draw rectangle with rounded corner.
- `void hpdftbl_set_bottom_vmargin_bottom (hpdftbl_t t, HPDF_REAL f)`
The margin from the bottom of the cell to the baseline of the text is calculated as a fraction of the font size. The margin is calculated as:
- `hpdftbl_t hpdftbl_create (size_t rows, size_t cols)`
Create a new table with no title.
- `hpdftbl_t hpdftbl_create_title (size_t rows, size_t cols, char *title)`
Create a new table with title top row.
- `int hpdftbl_set_min_rowheight (hpdftbl_t t, float h)`
Set the minimum row height in the table.
- `int hpdftbl_set_colwidth_percent (hpdftbl_t t, size_t c, float w)`
Set column width as percentage of overall table width.
- `int hpdftbl_set_outer_grid_style (hpdftbl_t t, HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle)`
Set outer border grid style.
- `int hpdftbl_set_inner_grid_style (hpdftbl_t t, HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle)`
Set inner border grid style.
- `int hpdftbl_set_inner_hgrid_style (hpdftbl_t t, HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle)`
Set inner horizontal border grid style.
- `int hpdftbl_set_inner_vgrid_style (hpdftbl_t t, HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle)`
Set inner vertical border grid style.
- `int hpdftbl_set_inner_tgrid_style (hpdftbl_t t, HPDF_REAL width, HPDF_RGBColor color, hpdftbl_line_dashstyle_t dashstyle)`
Set inner horizontal top border grid style.
- `int hpdftbl_set_header_style (hpdftbl_t t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_RGBColor background)`
Specify style for table header row.

- int [hpdftbl_set_background](#) ([hpdftbl_t](#) t, HPDF_RGBColor background)
Set table background color.
- int [hpdftbl_set_header_halign](#) ([hpdftbl_t](#) t, [hpdftbl_text_align_t](#) align)
Set table header horizontal text align.
- int [hpdftbl_use_header](#) ([hpdftbl_t](#) t, _Bool use)
Enable/disable the interpretation of the top row as a header row.
- int [hpdftbl_use_labels](#) ([hpdftbl_t](#) t, _Bool use)
- int [hpdftbl_use_labelgrid](#) ([hpdftbl_t](#) t, _Bool use)
Shorter vertical line to mark labels.
- int [hpdftbl_set_tag](#) ([hpdftbl_t](#) t, void *tag)
Set an optional tag for the table.
- int [hpdftbl_destroy](#) ([hpdftbl_t](#) t)
Destroy a table and free all memory.
- int [hpdftbl_set_cell](#) ([hpdftbl_t](#) t, int r, int c, char *label, char *content)
Set content for specific cell.
- int [hpdftbl_set_cellspan](#) ([hpdftbl_t](#) t, size_t r, size_t c, size_t rowspan, size_t colspan)
Set cell spanning.
- int [hpdftbl_clear_spanning](#) ([hpdftbl_t](#) t)
Clear all cell spanning.
- int [hpdftbl_set_content_cb](#) ([hpdftbl_t](#) t, [hpdftbl_content_callback_t](#) cb)
Set table content callback.
- int [hpdftbl_set_cell_content_cb](#) ([hpdftbl_t](#) t, size_t r, size_t c, [hpdftbl_content_callback_t](#) cb)
Set cell content callback.
- int [hpdftbl_set_cell_label_cb](#) ([hpdftbl_t](#) t, size_t r, size_t c, [hpdftbl_content_callback_t](#) cb)
Set cell label callback.
- int [hpdftbl_set_cell_canvas_cb](#) ([hpdftbl_t](#) t, size_t r, size_t c, [hpdftbl_canvas_callback_t](#) cb)
Set cell canvas callback.
- int [hpdftbl_set_label_cb](#) ([hpdftbl_t](#) t, [hpdftbl_content_callback_t](#) cb)
Set table label callback.
- int [hpdftbl_set_canvas_cb](#) ([hpdftbl_t](#) t, [hpdftbl_canvas_callback_t](#) cb)
Set cell canvas callback.
- int [hpdftbl_set_labels](#) ([hpdftbl_t](#) t, char **labels)
Set the text for the cell labels.
- int [hpdftbl_set_content](#) ([hpdftbl_t](#) t, char **content)
Set the content for the table.
- int [hpdftbl_set_label_style](#) ([hpdftbl_t](#) t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_↵
RGBColor background)
Set the style for labels in the entire table.
- int [hpdftbl_set_content_style](#) ([hpdftbl_t](#) t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_↵
RGBColor background)
Set style for text content.
- int [hpdftbl_set_row_content_style](#) ([hpdftbl_t](#) t, size_t r, char *font, HPDF_REAL fsize, HPDF_RGBColor color,
HPDF_RGBColor background)
Set the style for an entire row of cells.
- int [hpdftbl_set_col_content_style](#) ([hpdftbl_t](#) t, size_t c, char *font, HPDF_REAL fsize, HPDF_RGBColor color,
HPDF_RGBColor background)
Set the font style for an entire column of cells.
- int [hpdftbl_set_cell_content_style](#) ([hpdftbl_t](#) t, size_t r, size_t c, char *font, HPDF_REAL fsize, HPDF_↵
RGBColor color, HPDF_RGBColor background)
Set the font style for content of specified cell.
- int [hpdftbl_set_cell_content_style_cb](#) ([hpdftbl_t](#) t, size_t r, size_t c, [hpdftbl_content_style_callback_t](#) cb)

- Set cell specific callback to specify cell content style.*

 - int `hpdftbl_set_content_style_cb` (`hpdftbl_t` t, `hpdftbl_content_style_callback_t` cb)

Set callback to specify cell content style.
- int `hpdftbl_set_title_style` (`hpdftbl_t` t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_RGBColor background)

Set the table title style.
- int `hpdftbl_set_title` (`hpdftbl_t` t, char *title)

Set table title.
- int `hpdftbl_set_title_halign` (`hpdftbl_t` t, `hpdftbl_text_align_t` align)

Set horizontal alignment for table title.
- int `hpdftbl_stroke_from_data` (HPDF_Doc pdf_doc, HPDF_Page pdf_page, `hpdftbl_spec_t` *tbl_spec, `hpdftbl_theme_t` *theme)

Construct the table from a array specification.
- int `hpdftbl_get_last_auto_height` (HPDF_REAL *height)

Get the height calculated for the last constructed table.
- int `hpdftbl_stroke` (HPDF_Doc pdf, const HPDF_Page page, `hpdftbl_t` t, const HPDF_REAL xpos, const HPDF_REAL ypos, const HPDF_REAL width, HPDF_REAL height)

Stroke the table.

Variables

- int `hpdftbl_err_code` = 0

Stores the last generated error code.
- int `hpdftbl_err_row` = -1

The row where the last error was generated.
- int `hpdftbl_err_col` = -1

The column where the last error was generated.

15.6.1 Detailed Description

Main module for flexible table drawing with HPDF library.

15.6.2 Function Documentation

15.6.2.1 HPDF_RoundedCornerRectangle()

```
void HPDF_RoundedCornerRectangle (
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    HPDF_REAL width,
    HPDF_REAL height,
    HPDF_REAL rad )
```

Draw rectangle with rounded corner.

Draw a rectangle with rounded corner with the current line width, color. The rectangle will not be stroked.

Parameters

<i>page</i>	Page handle
<i>xpos</i>	Lower left x-position of rectangle
<i>ypos</i>	Lower left y-position of rectangle
<i>width</i>	Width of rectangle
<i>height</i>	Height of rectangle
<i>rad</i>	Radius of corners

Referenced by [hpdftbl_widget_slide_button\(\)](#).

15.6.2.2 hpdftbl_clear_spanning()

```
int hpdftbl_clear_spanning (
    hpdftbl_t t )
```

Clear all cell spanning.

Reset all spanning cells to no spanning

Parameters

<i>t</i>	Table handle
----------	--------------

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_cellspan\(\)](#)

15.6.2.3 hpdftbl_create()

```
hpdftbl_t hpdftbl_create (
    size_t rows,
    size_t cols )
```

Create a new table with no title.

Create a new table structure. This is the basic handler needed for most other API functions.

Parameters

<i>rows</i>	Number of rows
<i>cols</i>	Number of columns

Returns

A handle to a table, NULL in case of OOM

Examples

[tut_ex01.c](#), [tut_ex02.c](#), [tut_ex02_1.c](#), [tut_ex03.c](#), [tut_ex04.c](#), [tut_ex09.c](#), [tut_ex10.c](#), [tut_ex11.c](#), [tut_ex12.c](#),
and [tut_ex20.c](#).

15.6.2.4 hpdftbl_create_title()

```
hpdftbl_t hpdftbl_create_title (
    size_t rows,
    size_t cols,
    char * title )
```

Create a new table with title top row.

Create a new table structure. This is the basic handler needed for most other API functions.

Parameters

<i>rows</i>	Number of rows
<i>cols</i>	Number of columns
<i>title</i>	Title of table

Returns

A handle to a table, NULL in case of OOM

Examples

[example01.c](#), [tut_ex05.c](#), [tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), and [tut_ex14.c](#).

Referenced by [hpdftbl_create\(\)](#), and [hpdftbl_stroke_from_data\(\)](#).

15.6.2.5 hpdftbl_default_table_error_handler()

```
void hpdftbl_default_table_error_handler (
    hpdftbl_t t,
    int r,
    int c,
    int err )
```

A basic default table error handler.

This error handler is used as a callback that outputs the error to stderr in human readable format and quits the process.

Parameters

<i>t</i>	Table where the error happened (can be NULL)
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>err</i>	The error code

See also

[hpdftbl_set_errhandler\(\)](#)

Examples

[tut_ex10.c](#), [tut_ex11.c](#), and [tut_ex12.c](#).

15.6.2.6 hpdftbl_destroy()

```
int hpdftbl_destroy (
    hpdftbl_t t )
```

Destroy a table and free all memory.

Destroy a table previous created with [table_create\(\)](#), It is the calling routines responsibility not to access *t* again.

Parameters

<i>t</i>	Handle to table
----------	-----------------

Returns

0 on success, -1 on failure

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.7 hpdftbl_encoding_text_out()

```
int hpdftbl_encoding_text_out (
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    char * text )
```

Stroke text with current encoding.

Utility function to stroke text with character encoding. It is the calling routines responsibility to enclose text in a HPDF_Page_BeginText() / HPDF_Page_EndText()

Parameters

<i>page</i>	Page handle
<i>xpos</i>	X coordinate
<i>ypos</i>	Y coordinate
<i>text</i>	Text to print

Returns

-1 on error, 0 on success

15.6.2.8 hpdftbl_get_anchor_top_left()

```
_Bool hpdftbl_get_anchor_top_left (
    void )
```

Get stroking anchor point.

Get anchor point for table positioning. By default the top left is used.

See also

[hpdftbl_set_anchor_top_left](#)

Returns

TRUE if anchor is top left, FALSE otherwise

15.6.2.9 hpdftbl_get_errstr()

```
const char * hpdftbl_get_errstr (
    int err )
```

Translate a table error code to a human readable string.

The function returns a pointer to a static string that cannot be modified. It will translate both internal table error messages as well as generic HPDF library error codes.

Parameters

<i>err</i>	The error code to be translated
------------	---------------------------------

Returns

Static pointer to string for valid error code, NULL otherwise

See also

[hpdftbl_hpdf_get_errstr\(\)](#)

Referenced by [hpdftbl_default_table_error_handler\(\)](#), and [hpdftbl_get_last_errcode\(\)](#).

15.6.2.10 hpdftbl_get_last_auto_height()

```
int hpdftbl_get_last_auto_height (
    HPDF_REAL * height )
```

Get the height calculated for the last constructed table.

Get the last automatically calculated height when stroking a table. (The height will be automatically calculated if it was specified as 0)

Parameters

<i>height</i>	Returned height
---------------	-----------------

Returns

-1 on error, 0 if successful

15.6.2.11 hpdftbl_get_last_errcode()

```
int hpdftbl_get_last_errcode (
    const char ** errstr,
```

```
int * row,
int * col )
```

Return last error code.

Return last error code. if `errstr` is not NULL a human readable string describing the error will be copied to the string. The error code will be reset after call.

Parameters

<i>errstr</i>	A string buffer where the error string is written to
<i>row</i>	The row where the error was found
<i>col</i>	The col where the error was found

Returns

The last error code

Examples

[example01.c](#).

15.6.2.12 `hpdf_tbl_set_anchor_top_left()`

```
void hpdf_tbl_set_anchor_top_left (
    const _Bool anchor )
```

Switch stroking anchor point.

Set anchor point for table positioning. By default the top left is used as anchor. Calling this function with FALSE can sets the anchor to bottom left instead.

Parameters

<i>anchor</i>	Set to TRUE to use top left as anchor, FALSE for bottom left
---------------	--

15.6.2.13 `hpdf_tbl_set_background()`

```
int hpdf_tbl_set_background (
    hpdf_tbl_t t,
    HPDF_RGBColor background )
```

Set table background color.

Parameters

<i>t</i>	Table handle
<i>background</i>	Background color

Returns

0 on success, -1 on failure

15.6.2.14 hpdftbl_set_bottom_vmargin_bottom()

```
void hpdftbl_set_bottom_vmargin_bottom (
    hpdftbl_t t,
    HPDF_REAL f )
```

The margin from the bottom of the cell to the baseline of the text is calculated as a fraction of the font size. The margin is calculated as:

```
bottom_margin = fontsize * f
```

The default margin is specified by the define [DEFAULT_AUTO_VBOTTOM_MARGIN_FACTOR](#)

Parameters

<i>t</i>	Table handle
<i>f</i>	Bottom margin factor

15.6.2.15 hpdftbl_set_canvas_cb()

```
int hpdftbl_set_canvas_cb (
    hpdftbl_t t,
    hpdftbl_canvas_callback_t cb )
```

Set cell canvas callback.

Set cell canvas callback. This callback gets called for each cell in the table. The purpose is to allow the client to add dynamic content to the specified cell. The callback is made before the cell border and content is drawn making it possible to for example add a background color to individual cells. The callback function will receive the Table tag, the row and column, the x, y position of the lower left corner of the table and the width and height of the cell. To set the canvas callback only for a sepcific cell use the [hpdftbl_set_cell_canvas_callback\(\)](#) function

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

-1 on failure, 0 otherwise

See also

[hpdftbl_set_cell_canvas_cb\(\)](#)

15.6.2.16 `hpdftbl_set_cell()`

```
int hpdftbl_set_cell (
    hpdftbl_t t,
    int r,
    int c,
    char * label,
    char * content )
```

Set content for specific cell.

Set label and content for a specific cell. If the specified cell is part of another cells spanning an error occurs (returns -1),

Parameters

<i>t</i>	Table handle
<i>r</i>	Row
<i>c</i>	Column
<i>label</i>	Label
<i>content</i>	Text content

Returns

-1 on error, 0 if successful

Examples

[tut_ex01.c](#), and [tut_ex03.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.17 `hpdftbl_set_cell_canvas_cb()`

```
int hpdftbl_set_cell_canvas_cb (
    hpdftbl_t t,
    size_t r,
    size_t c,
    hpdftbl_canvas_callback_t cb )
```

Set cell canvas callback.

Set a canvas callback for an individual cell. This will override the table canvas callback. The canvas callback is called with arguments that give the bounding box for the cell. In that way a callback function may draw arbitrary graphic in the cell. The callback is made before the cell border and content is drawn making it possible to for example add a background color to individual cells. The callback function will receive the Table tag, the row and column, the x, y position of the lower left corner of the table and the width and height of the cell.

Parameters

<i>t</i>	Table handle
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>cb</i>	Callback function

Returns

-1 on failure, 0 otherwise

See also

[hpdftbl_canvas_callback_t](#)

[hpdftbl_set_canvas_callback](#)

Examples

[example01.c](#), and [tut_ex14.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.18 hpdftbl_set_cell_content_cb()

```
int hpdftbl_set_cell_content_cb (
    hpdftbl_t t,
    size_t r,
    size_t c,
    hpdftbl_content_callback_t cb )
```

Set cell content callback.

Set a content callback for an individual cell. This will override the table content callback. The callback function will receive the Table tag and the row and column for the cell the callback is made for.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function
<i>r</i>	Cell row
<i>c</i>	Cell column

Returns

-1 on failure, 0 otherwise

See also

[hpdftbl_set_content_cb\(\)](#)

Examples

[tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), and [tut_ex14.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.19 `hpdfdbl_set_cell_content_style()`

```
int hpdfdbl_set_cell_content_style (
    hpdfdbl_t t,
    size_t r,
    size_t c,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the font style for content of specified cell.

SSet the font style for content of specified cell. This will override the global cell content setting.

Parameters

<i>t</i>	Table handle
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

See also

[hpdfdbl_set_content_style\(\)](#)
[hpdfdbl_set_cell_content_style_cb\(\)](#)

Examples

[example01.c](#).

Referenced by [hpdfdbl_set_col_content_style\(\)](#), and [hpdfdbl_set_row_content_style\(\)](#).

15.6.2.20 `hpdfdbl_set_cell_content_style_cb()`

```
int hpdfdbl_set_cell_content_style_cb (
    hpdfdbl_t t,
    size_t r,
    size_t c,
    hpdfdbl_content_style_callback_t cb )
```

Set cell specific callback to specify cell content style.

Set callback to format the style for the specified cell

Parameters

<i>t</i>	Table handle
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>cb</i>	Callback function

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_ontent_style_cb\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.21 hpdftbl_set_cell_label_cb()

```
int hpdftbl_set_cell_label_cb (  
    hpdftbl_t t,  
    size_t r,  
    size_t c,  
    hpdftbl_content_callback_t cb )
```

Set cell label callback.

Set a label callback for an individual cell. This will override the table label callback. The callback function will receive the Table tag and the row and column for the cell the callback is made for.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function
<i>r</i>	Cell row
<i>c</i>	Cell column

Returns

-1 on failure, 0 otherwise

See also

[hpdftbl_set_label_cb\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.22 `hpdfdbl_set_cellspan()`

```
int hpdfdbl_set_cellspan (
    hpdfdbl_t t,
    size_t r,
    size_t c,
    size_t rowspan,
    size_t colspan )
```

Set cell spanning.

Set row and column spanning for a cell, an expanded cell is referenced via the position of it's top-left cell

Parameters

<i>t</i>	Table handle
<i>r</i>	Row
<i>c</i>	Column
<i>rowspan</i>	Row span
<i>colspan</i>	Column span

Returns

-1 on error, 0 if successful

See also

[hpdfdbl_clear_spanning\(\)](#)

Examples

[example01.c](#), [tut_ex07.c](#), and [tut_ex08.c](#).

Referenced by [hpdfdbl_stroke_from_data\(\)](#).

15.6.2.23 `hpdfdbl_set_col_content_style()`

```
int hpdfdbl_set_col_content_style (
    hpdfdbl_t t,
    size_t c,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the font style for an entire column of cells.

Set font options for the specified column of cells. This will override the global cell content setting.

Parameters

<i>t</i>	Table handle
<i>c</i>	Column to affect
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_content_style\(\)](#)

[hpdftbl_set_cell_content_style_cb\(\)](#)

15.6.2.24 hpdftbl_set_colwidth_percent()

```
int hpdftbl_set_colwidth_percent (
    hpdftbl_t t,
    size_t c,
    float w )
```

Set column width as percentage of overall table width.

Specify column width as percentage of total column width. Note that this will only take effect if the table has an overall width specified when stroked. Too avoid errors one column should be left unspecified to let the library use whatever space is left for that column.

Parameters

<i>t</i>	Table handle
<i>c</i>	Column to set width of first column has index 0
<i>w</i>	Width as percentage in range [0.0, 100.0]

Returns

0 on success, -1 on failure

Examples

[example01.c](#), [tut_ex08.c](#), [tut_ex09.c](#), [tut_ex10.c](#), [tut_ex11.c](#), and [tut_ex12.c](#).

15.6.2.25 `hpdftbl_set_content()`

```
int hpdftbl_set_content (
    hpdftbl_t t,
    char ** content )
```

Set the content for the table.

Set content for all cells. It is the calling functions responsibility that the content array is big enough to cover the entire table. The string array corresponds to a flattened 2-d array and the label for cell (r,c) is calculated as (r * num_cols + c) where num_cols is the number of columns in the table.

It is allowed to specify NULL as placeholder for empty labels. The actual text in the table will be allocated with `strdup()` so it is safe to free the memory for the labels after the call to this function. Please note that even if the table contains spanning cells the content data must include empty data for covered cells. For a N x M table the data must have (N*M) entries.

Another way to specify the content is to use the callback mechanism. By setting up a content callback function that returns the content for a cell.

Parameters

<i>t</i>	Table handle
<i>content</i>	A one dimensional string array of content string

Returns

-1 on error, 0 if successful

See also

`hpdftbl_set_content_callback()`
`hpdftbl_set_cell_content_callback()`

Examples

[example01.c](#), [tut_ex02.c](#), [tut_ex02_1.c](#), [tut_ex04.c](#), [tut_ex05.c](#), [tut_ex10.c](#), [tut_ex11.c](#), [tut_ex12.c](#), and [tut_ex20.c](#).

15.6.2.26 `hpdftbl_set_content_cb()`

```
int hpdftbl_set_content_cb (
    hpdftbl_t t,
    hpdftbl_content_callback_t cb )
```

Set table content callback.

This callback gets called for each cell in the table and the returned string will be used as the content. The string will be duplicated so it is safe for a client to reuse the string space. If NULL is returned from the callback then the content will be set to the content specified with the direct content setting. The callback function will receive the Table tag and the row and column for the cell the callback is made for.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

-1 for error , 0 otherwise

See also

[hpdftbl_set_cell_content_cb\(\)](#)

Examples

[tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), and [tut_ex09.c](#).

15.6.2.27 hpdftbl_set_content_style()

```
int hpdftbl_set_content_style (
    hpdftbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set style for text content.

Set style options for cell content (font, color, background). This will be applied for all cells in the table. If a style callback have been specified for either the table or a cell that style take precedence.

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

-1 on error, 0 if successful

See also

[hpdftbl_set_cell_content_style\(\)](#)

Examples

[example01.c](#).

Referenced by [hpdftbl_apply_theme\(\)](#).

15.6.2.28 hpdftbl_set_content_style_cb()

```
int hpdftbl_set_content_style_cb (
    hpdftbl_t t,
    hpdftbl_content_style_callback_t cb )
```

Set callback to specify cell content style.

Set callback to format the style for cells in the table. If a cell has its own content style callback that callback will override the generic table callback.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_cell_content_style_cb\(\)](#)

Examples

[tut_ex09.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.29 hpdftbl_set_errhandler()

```
hpdftbl_error_handler_t hpdftbl_set_errhandler (
    hpdftbl_error_handler_t err_handler )
```

Specify errhandler for the table routines.

Note: The library provides a basic default error handler that can be used,

Parameters

<i>err_handler</i>	
--------------------	--

Returns

The old error handler or NULL if non exists

See also

[hpdftbl_default_table_error_handler\(\)](#)

Examples

[tut_ex10.c](#), [tut_ex11.c](#), and [tut_ex12.c](#).

15.6.2.30 hpdftbl_set_header_halign()

```
int hpdftbl_set_header_halign (
    hpdftbl_t t,
    hpdftbl_text_align_t align )
```

Set table header horizontal text align.

Parameters

<i>t</i>	Table handle
<i>align</i>	Alignment

Returns

0 on success, -1 on failure

Referenced by [hpdftbl_apply_theme\(\)](#).

15.6.2.31 hpdftbl_set_header_style()

```
int hpdftbl_set_header_style (
    hpdftbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Specify style for table header row.

Set the font properties and background for the header row which is the top row if enabled. The header row will be automatically enabled after calling this function. The header can be enabled/disabled separately with [hpdftbl_use_header\(\)](#)

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Font color
<i>background</i>	Cell background color

Returns

0 on success, -1 on failure

See also

[hpdfdbl_use_header\(\)](#)

Referenced by [hpdfdbl_apply_theme\(\)](#).

15.6.2.32 hpdfdbl_set_inner_grid_style()

```
int hpdfdbl_set_inner_grid_style (
    hpdfdbl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdfdbl_line_dashstyle_t dashstyle )
```

Set inner border grid style.

This is a shortform to set both the vertical and horizontal gridline style with one call.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdfdbl_set_inner_hgrid_style\(\)](#), [hpdfdbl_set_inner_vgrid_style\(\)](#), [hpdfdbl_set_outer_grid_style\(\)](#)

15.6.2.33 hpdftbl_set_inner_hgrid_style()

```
int hpdftbl_set_inner_hgrid_style (
    hpdftbl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdftbl_line_dashstyle_t dashstyle )
```

Set inner horizontal border grid style.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_inner_grid_style\(\)](#), [hpdftbl_set_inner_vgrid_style\(\)](#)

Examples

[tut_ex20.c](#).

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_set_inner_grid_style\(\)](#).

15.6.2.34 hpdftbl_set_inner_tgrid_style()

```
int hpdftbl_set_inner_tgrid_style (
    hpdftbl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdftbl_line_dashstyle_t dashstyle )
```

Set inner horizontal top border grid style.

This would be the gridline just below the header row.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

Referenced by [hpdfctl_apply_theme\(\)](#).

15.6.2.35 hpdfctl_set_inner_vgrid_style()

```
int hpdfctl_set_inner_vgrid_style (
    hpdfctl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdfctl_line_dashstyle_t dashstyle )
```

Set inner vertical border grid style.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

15.6.2.36 hpdftbl_set_label_cb()

```
int hpdftbl_set_label_cb (
    hpdftbl_t t,
    hpdftbl_content_callback_t cb )
```

Set table label callback.

Set label callback. This callback gets called for each cell in the table and the returned string will be used as the label. The string will be duplicated so it is safe for a client to reuse the string space. If NULL is returned from the callback then the label will be set to the content specified with the direct label setting. The callback function will receive the Table tag and the row and column

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

-1 on failure, 0 otherwise

See also

[hpdftbl_content_callback_t](#)
[hpdftbl_set_cell_label_cb\(\)](#)

Examples

[tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), and [tut_ex14.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.37 hpdftbl_set_label_style()

```
int hpdftbl_set_label_style (
    hpdftbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the style for labels in the entire table.

Set font, color and background options for cell labels. If a style callback have been specified for either the table or a cell that style take precedence.

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

-1 on error, 0 if successful

Referenced by [hpdftbl_apply_theme\(\)](#).

15.6.2.38 hpdftbl_set_labels()

```
int hpdftbl_set_labels (
    hpdftbl_t t,
    char ** labels )
```

Set the text for the cell labels.

Set labels for all the cell. It is the calling functions responsibility that the labels array is big enough to cover the entire table. The string array corresponds to a flattened 2-d array and the label for cell (r,c) is calculated as (r * num_cols + c) where num_cols is the number of columns in the table.

It is allowed to specify NULL as placeholder for empty labels. The actual text in the table will be allocated with `strdup()` so it is safe to free the memory for the labels after the call to this function. Please note that even if the table contains spanning cells the content data must include empty data for covered cells. For a N x M table the data must have (N*M) entries.

Parameters

<i>t</i>	Table handle
<i>labels</i>	A one dimensional string array of labels

Returns

-1 on error, 0 if successful

See also

[hpdftbl_set_cell_label_cb\(\)](#)

[hpdftbl_set_label_cb\(\)](#)

Examples

[example01.c](#), [tut_ex04.c](#), [tut_ex05.c](#), and [tut_ex20.c](#).

15.6.2.39 hpdftbl_set_line_dash()

```
int hpdftbl_set_line_dash (
    hpdftbl_t t,
    hpdftbl_line_dashstyle_t style )
```

Internal helper to set the line style.

The drawing of a dashed line uses the underlying HPDF function `HPDF_Page_SetDash()`

Parameters

<i>t</i>	Table handle
<i>style</i>	

Returns

-1 on error, 0 on success

See also

[line_dash_style](#)

15.6.2.40 hpdftbl_set_min_rowheight()

```
int hpdftbl_set_min_rowheight (
    hpdftbl_t t,
    float h )
```

Set the minimum row height in the table.

The row height is normally calculated based on the font size and if labels are displayed or not. However, it is not possible for the table to know the height of specific widgets (for example) without a two-pass table drawing algorithm.

To handle those odd cases when the calculated height is not sufficient a manual minimum height can be specified.

Parameters

<i>t</i>	Table handler
<i>h</i>	The minimum height (in points). If specified as 0 the min height will have no effect.

Returns

0 on success, -1 on failure

Examples

[example01.c](#).

15.6.2.41 hpdftbl_set_outer_grid_style()

```
int hpdftbl_set_outer_grid_style (
    hpdftbl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdftbl_line_dashstyle_t dashstyle )
```

Set outer border grid style.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_inner_grid_style\(\)](#)

Examples

[tut_ex20.c](#).

Referenced by [hpdftbl_apply_theme\(\)](#).

15.6.2.42 hpdftbl_set_row_content_style()

```
int hpdftbl_set_row_content_style (
    hpdftbl_t t,
    size_t r,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the style for an entire row of cells.

Set font options for the specified row of cells. This will override the global cell content.

Parameters

<i>t</i>	Table handle
<i>r</i>	Row to affect
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_content_style\(\)](#)

[hpdftbl_set_cell_content_style_cb\(\)](#)

15.6.2.43 hpdftbl_set_tag()

```
int hpdftbl_set_tag (
    hpdftbl_t t,
    void * tag )
```

Set an optional tag for the table.

Set an optional tag in the table. The tag can be a pointer to anything. The tag is passed as the first argument in the various callbacks and can be used to supply table specific information or identify a specific table in the case the same callback is used for multiple tables.

Parameters

<i>t</i>	The table handle
<i>tag</i>	The tag (pointer to any object)

Returns

0 on success, -1 on failure

15.6.2.44 hpdftbl_set_text_encoding()

```
void hpdftbl_set_text_encoding (
    char * target,
    char * source )
```

Determine text source encoding.

The default HPDF encoding is a standard PDF encoding. The problem with that is that now almost 100% of all code is written in UTF-8 encoding and trying to print text strings with accented characters will simply not work. For example the default encoding assumes that strings are given in UTF-8 and sets the target to ISO8859-4 which includes northern europe accented characters. The conversion is internally handled by the standard iconv() routines.

Parameters

<i>target</i>	The target encoding. See HPDF documentation for supported encodings.
<i>source</i>	The source encodings, i.e. what encodings are sth strings in the source specified in.

15.6.2.45 `hpdfctl_set_title()`

```
int hpdfctl_set_title (
    hpdfctl_t t,
    char * title )
```

Set table title.

Set table title. A title will occupy a separate row above the table that is not included in the row count. A table is enabled when the table text is <> NULL and disabled when the title text is == NULL.

Parameters

<i>t</i>	Table handle
<i>title</i>	Title string

Returns

0 on success, -1 on failure

See also

[hpdfctl_set_title_style\(\)](#)

[hpdfctl_set_title_halign\(\)](#)

15.6.2.46 `hpdfctl_set_title_halign()`

```
int hpdfctl_set_title_halign (
    hpdfctl_t t,
    hpdfctl_text_align_t align )
```

Set horizontal alignment for table title.

Parameters

<i>t</i>	Table handle
<i>align</i>	Alignment

Returns

0 on success, -1 on failure

See also

[hpdfctl_set_title\(\)](#)

[hpdfctl_set_title_style\(\)](#)

Examples

[example01.c](#).

Referenced by [hpdftbl_apply_theme\(\)](#).

15.6.2.47 hpdftbl_set_title_style()

```
int hpdftbl_set_title_style (
    hpdftbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the table title style.

Set font options for title

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_title\(\)](#)

Examples

[example01.c](#).

Referenced by [hpdftbl_apply_theme\(\)](#).

15.6.2.48 `hpdfdbl_stroke()`

```
int hpdfdbl_stroke (
    HPDF_Doc pdf,
    const HPDF_Page page,
    hpdfdbl_t t,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
    HPDF_REAL height )
```

Stroke the table.

Stroke the table at the specified position and size. The position is by default specified as the upper left corner of the table. Use the `hpdfdbl_set_origin_top_left(FALSE)` to use the bottom left of the table as reference point.

Parameters

<i>pdf</i>	The HPDF document handle
<i>page</i>	The HPDF page handle
<i>t</i>	Table handle
<i>xpos</i>	x position for table, bottom left corner
<i>ypos</i>	y position for table, bottom left corner
<i>width</i>	width of table
<i>height</i>	height of table. If the height is specified as 0 it will be automatically calculated. The calculated height can be retrieved after the table has been stroked by a call to hpdfdbl_get_last_auto_height()

Returns

-1 on error, 0 if successful

See also

[hpdfdbl_get_last_auto_height\(\)](#)

[hpdfdbl_stroke_from_data\(\)](#)

Examples

[example01.c](#), [tut_ex01.c](#), [tut_ex02.c](#), [tut_ex02_1.c](#), [tut_ex03.c](#), [tut_ex04.c](#), [tut_ex05.c](#), [tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), [tut_ex09.c](#), [tut_ex10.c](#), [tut_ex11.c](#), [tut_ex12.c](#), [tut_ex14.c](#), and [tut_ex20.c](#).

Referenced by [hpdfdbl_stroke_from_data\(\)](#).

15.6.2.49 `hpdfdbl_stroke_from_data()`

```
int hpdfdbl_stroke_from_data (
    HPDF_Doc pdf_doc,
    HPDF_Page pdf_page,
    hpdfdbl_spec_t * tbl_spec,
    hpdfdbl_theme_t * theme )
```

Construct the table from a array specification.

Create and stroke a table specified by a data structure. This makes it easier to separate the view of the data from the model which provides the data. The intended use case is that the data structure specifies the core layout of the table together with the labels and callback functions to handle the content in each cell. Using this method to create a table also makes it much more maintainable.

Parameters

<i>pdf_doc</i>	The PDF overall document
<i>pdf_page</i>	The pageto stroke to
<i>tbl_spec</i>	The table specification
<i>theme</i>	Table theme to be applied

Returns

0 on success, -1 on failure

See also

[hpdfdbl_stroke\(\)](#)

Examples

[example01.c](#), [tut_ex13_1.c](#), and [tut_ex13_2.c](#).

15.6.2.50 hpdfdbl_use_header()

```
int hpdfdbl_use_header (
    hpdfdbl_t t,
    _Bool use )
```

Enable/disable the interpretation of the top row as a header row.

A header row will have a different style and labels will be disabled on this row. In addition the text will be centered vertically and horizontal in the cell.

Parameters

<i>t</i>	Table handle
<i>use</i>	TRUE to enable, FALSE to disable

Returns

0 on success, -1 on failure

See also

[hpdfdbl_set_header_style\(\)](#)

Examples

[example01.c](#), [tut_ex02_1.c](#), [tut_ex11.c](#), [tut_ex12.c](#), and [tut_ex20.c](#).

Referenced by [hpdfdbl_stroke_from_data\(\)](#).

15.6.2.51 hpdftbl_use_labelgrid()

```
int hpdftbl_use_labelgrid (
    hpdftbl_t t,
    _Bool use )
```

Shorter vertical line to mark labels.

Set the usage of special grid style where the vertical grid only covers the label text and a gap to the next line. Horizontal lines are drawn as usual. The label grid style gives the table a "lighter" look.

Parameters

<i>t</i>	Table handle
<i>use</i>	TRUE to use label grid, FALSE o disable it

Returns

0 on success, -1 on failure

See also

[hpdftbl_use_labels\(\)](#)

Examples

[example01.c](#), [tut_ex03.c](#), [tut_ex04.c](#), [tut_ex05.c](#), [tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), [tut_ex14.c](#), and [tut_ex20.c](#).

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.6.2.52 hpdftbl_use_labels()

```
int hpdftbl_use_labels (
    hpdftbl_t t,
    _Bool use )
```

@brief Enable/Disable the use of cell labels.

By default a newly created table will not use cell labels. Enabling labels will also by default enable the special label grid style. To adjust the grid style separately us the [hpdftbl_use_labelgrid\(\)](#) method.

Parameters

<i>t</i>	Table handle
<i>use</i>	Set to TRUE for cell labels

Returns

0 on success, -1 on failure

See also

- `#define HPDF_COLOR_SILVER` (HPDF_RGBColor) { 0.75f, 0.75f, 0.75f }
- `#define HPDF_COLOR_LIGHT_BLUE` (HPDF_RGBColor) { 1.0f, 1.0f, 0.9f }
- `#define HPDF_COLOR_BLUE` (HPDF_RGBColor) { 0.0f, 0.0f, 1.0f }
- `#define HPDF_COLOR_DARK_BLUE` (HPDF_RGBColor) { 0.0f, 0.0f, 0.6f }
- `#define HPDF_COLOR_WHITE` (HPDF_RGBColor) { 1.0f, 1.0f, 1.0f }
- `#define HPDF_COLOR_BLACK` (HPDF_RGBColor) { 0.0f, 0.0f, 0.0f }
- `#define DEFAULT_AUTO_VBOTTOM_MARGIN_FACTOR` 0.5
The margin from the bottom of the cell to the baseline of the text is calculated as a fraction of the font size.
- `#define HPDFTBL_DEFAULT_TARGET_ENCODING` "ISO8859-4"
Default PDF text encodings.
- `#define HPDFTBL_DEFAULT_SOURCE_ENCODING` "UTF-8"
Default input source text encodings.
- `#define A4PAGE_HEIGHT_CM` 29.7
Standard A4 paper height in cm.
- `#define A4PAGE_WIDTH_CM` 21.0
Standard A4 paper width in cm.
- `#define A3PAGE_HEIGHT_CM` 42.0
Standard A3 paper height in cm.
- `#define A3PAGE_WIDTH_CM` 29.7
Standard A3 paper width in cm.
- `#define LETTERPAGE_HEIGHT_CM` 27.9
US Letter Height in cm.
- `#define LETTERPAGE_WIDTH_CM` 21.6
US Letter width in cm.
- `#define LEGALPAGE_HEIGHT_CM` 35.6
US Legal Height in cm.
- `#define LEGALPAGE_WIDTH_CM` 21.6
US Legal Width in cm.
- `#define HPDFTBL_END_CELLSPECS` {0, 0, 0, 0, 0, 0, 0, 0, 0}
Sentinel to mark the end of Cell Specifications for data driven table definition.
- `#define HPDF_COLOR_FROMRGB(r, g, b)` (HPDF_RGBColor){(r)/255.0,(g)/255.0,(b)/255.0}
Utility macro to calculate a color constant from RGB integer values [0,255].
- `#define HPDFTBL_MIN_CALCULATED_PERCENT_CELL_WIDTH` 2.0
The smallest size in percent of table width allowed by automatic calculation before giving an error.
- `#define hpdftbl_cm2dpi(c)` (((HPDF_REAL)(c))/2.54*72)
Convert cm to dots using the default resolution (72 DPI)

- `#define _HPDFTBL_SET_ERR(t, err, r, c) do {hpdfdbl_err_code=err;hpdfdbl_err_row=r;hpdfdbl_err_col=c; if(hpdfdbl_err_handler){hpdfdbl_err_handler(t,r,c,err);}} while(0)`
Call the error handler with specified error code and table row, col where error occurred.
- `#define HPDFTBL_CHK_TABLE(t) do {if(NULL == t) {hpdfdbl_err_code=-3;hpdfdbl_err_row=-1;hpdfdbl_err_col=-1;return -1;}} while(0)`
NPE check before using a table handler.
- `#define HPDFTBL_IDX(r, c) (r*t->cols+c)`
Shortcut to calculate the index in an array from a row,column (table) position.

Typedefs

- `typedef enum hpdfdbl_text_align hpdfdbl_text_align_t`
Enumeration for horizontal text alignment.
- `typedef struct text_style hpdf_text_style_t`
Specification of a text style.
- `typedef char *(* hpdfdbl_content_callback_t) (void *, size_t, size_t)`
Type specification for the table content callback.
- `typedef void(* hpdfdbl_canvas_callback_t) (HPDF_Doc, HPDF_Page, void *, size_t, size_t, HPDF_REAL, HPDF_REAL, HPDF_REAL, HPDF_REAL)`
Type specification for the table canvas callback.
- `typedef _Bool(* hpdfdbl_content_style_callback_t) (void *, size_t, size_t, char *content, hpdf_text_style_t *)`
Type specification for the content style.
- `typedef enum hpdfdbl_dashstyle hpdfdbl_line_dashstyle_t`
Possible line dash styles for grid lines.
- `typedef struct grid_style hpdfdbl_grid_style_t`
Specification for table grid lines.
- `typedef struct hpdfdbl_cell hpdfdbl_cell_t`
Type definition for the cell structure.
- `typedef struct hpdfdbl * hpdfdbl_t`
Table handle is a pointer to the hpdfdbl structure.
- `typedef void(* hpdfdbl_callback_t) (hpdfdbl_t)`
Callback type for optional post processing when constructing table from a data array.
- `typedef struct hpdfdbl_cell_spec hpdfdbl_cell_spec_t`
Used in data driven table creation.
- `typedef struct hpdfdbl_spec hpdfdbl_spec_t`
Used in data driven table creation.
- `typedef struct hpdfdbl_theme hpdfdbl_theme_t`
Define a set of styles into a table theme.
- `typedef void(* hpdfdbl_error_handler_t) (hpdfdbl_t, int, int, int)`
Type for error handler function.

Enumerations

- `enum hpdfdbl_text_align { LEFT = 0 , CENTER = 1 , RIGHT = 2 }`
Enumeration for horizontal text alignment.
- `enum hpdfdbl_dashstyle {
LINE_SOLID = 0 , LINE_DOT1 = 1 , LINE_DOT2 = 2 , LINE_DOT3 = 3 ,
LINE_DASH1 = 4 , LINE_DASH2 = 5 , LINE_DASH3 = 6 , LINE_DASH4 = 7 ,
LINE_DASHDOT1 = 8 , LINE_DASHDOT2 = 9 }`
Possible line dash styles for grid lines.

Functions

- [hpdftbl_t hpdftbl_create](#) (size_t rows, size_t cols)
Create a new table with no title.
- [hpdftbl_t hpdftbl_create_title](#) (size_t rows, size_t cols, char *title)
Create a new table with title top row.
- int [hpdftbl_stroke](#) (HPDF_Doc pdf, HPDF_Page page, [hpdftbl_t](#) t, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height)
Stroke the table.
- int [hpdftbl_stroke_from_data](#) (HPDF_Doc pdf_doc, HPDF_Page pdf_page, [hpdftbl_spec_t](#) *tbl_spec, [hpdftbl_theme_t](#) *theme)
Construct the table from a array specification.
- int [hpdftbl_destroy](#) ([hpdftbl_t](#) t)
Destroy a table and free all memory.
- int [hpdftbl_get_last_auto_height](#) (HPDF_REAL *height)
Get the height calculated for the last constructed table.
- void [hpdftbl_set_anchor_top_left](#) (_Bool anchor)
Switch stroking anchor point.
- _Bool [hpdftbl_get_anchor_top_left](#) (void)
Get stroking anchor point.
- [hpdftbl_error_handler_t](#) [hpdftbl_set_errhandler](#) ([hpdftbl_error_handler_t](#))
Specify errhandler for the table routines.
- const char * [hpdftbl_get_errstr](#) (int err)
Translate a table error code to a human readable string.
- const char * [hpdftbl_hpdf_get_errstr](#) (HPDF_STATUS err_code)
Function to return a human readable error string for an error code from Core HPDF library.
- int [hpdftbl_get_last_errcode](#) (const char **errstr, int *row, int *col)
Return last error code.
- void [hpdftbl_default_table_error_handler](#) ([hpdftbl_t](#) t, int r, int c, int err)
A basic default table error handler.
- int [hpdftbl_apply_theme](#) ([hpdftbl_t](#) t, [hpdftbl_theme_t](#) *theme)
Apply a specified theme to a table.
- [hpdftbl_theme_t](#) * [hpdftbl_get_default_theme](#) (void)
Return the default theme.
- int [hpdftbl_destroy_theme](#) ([hpdftbl_theme_t](#) *theme)
Destroy existing theme structure and free memory.
- void [hpdftbl_set_bottom_vmargin_bottom](#) ([hpdftbl_t](#) t, HPDF_REAL f)
The margin from the bottom of the cell to the baseline of the text is calculated as a fraction of the font size. The margin is calculated as:
- int [hpdftbl_set_min_rowheight](#) ([hpdftbl_t](#) t, float h)
Set the minimum row height in the table.
- int [hpdftbl_set_colwidth_percent](#) ([hpdftbl_t](#) t, size_t c, float w)
Set column width as percentage of overall table width.
- int [hpdftbl_clear_spanning](#) ([hpdftbl_t](#) t)
Clear all cell spanning.
- int [hpdftbl_set_cellspan](#) ([hpdftbl_t](#) t, size_t r, size_t c, size_t rowspan, size_t colspan)
Set cell spanning.
- int [hpdftbl_use_labels](#) ([hpdftbl_t](#) t, _Bool use)
- int [hpdftbl_use_labelgrid](#) ([hpdftbl_t](#) t, _Bool use)
Shorter vertical line to mark labels.
- int [hpdftbl_set_background](#) ([hpdftbl_t](#) t, HPDF_RGBColor background)

Set table background color.

- int `hpdftbl_set_inner_tgrid_style` (`hpdftbl_t` t, HPDF_REAL width, HPDF_RGBColor color, `hpdftbl_line_dashstyle_t` dashstyle)

Set inner horizontal top border grid style.

- int `hpdftbl_set_inner_vgrid_style` (`hpdftbl_t` t, HPDF_REAL width, HPDF_RGBColor color, `hpdftbl_line_dashstyle_t` dashstyle)

Set inner vertical border grid style.

- int `hpdftbl_set_inner_hgrid_style` (`hpdftbl_t` t, HPDF_REAL width, HPDF_RGBColor color, `hpdftbl_line_dashstyle_t` dashstyle)

Set inner horizontal border grid style.

- int `hpdftbl_set_inner_grid_style` (`hpdftbl_t` t, HPDF_REAL width, HPDF_RGBColor color, `hpdftbl_line_dashstyle_t` dashstyle)

Set inner border grid style.

- int `hpdftbl_set_outer_grid_style` (`hpdftbl_t` t, HPDF_REAL width, HPDF_RGBColor color, `hpdftbl_line_dashstyle_t` dashstyle)

Set outer border grid style.

- int `hpdftbl_set_header_style` (`hpdftbl_t` t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_↔ RGBColor background)

Specify style for table header row.

- int `hpdftbl_set_header_halign` (`hpdftbl_t` t, `hpdftbl_text_align_t` align)

Set table header horizontal text align.

- int `hpdftbl_use_header` (`hpdftbl_t` t, _Bool use)

Enable/disable the interpretation of the top row as a header row.

- int `hpdftbl_set_label_style` (`hpdftbl_t` t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_↔ RGBColor background)

Set the style for labels in the entire table.

- int `hpdftbl_set_row_content_style` (`hpdftbl_t` t, size_t r, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_RGBColor background)

Set the style for an entire row of cells.

- int `hpdftbl_set_col_content_style` (`hpdftbl_t` t, size_t c, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_RGBColor background)

Set the font style for an entire column of cells.

- int `hpdftbl_set_content_style` (`hpdftbl_t` t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_↔ RGBColor background)

Set style for text content.

- int `hpdftbl_set_cell_content_style` (`hpdftbl_t` t, size_t r, size_t c, char *font, HPDF_REAL fsize, HPDF_↔ RGBColor color, HPDF_RGBColor background)

Set the font style for content of specified cell.

- int `hpdftbl_set_title_style` (`hpdftbl_t` t, char *font, HPDF_REAL fsize, HPDF_RGBColor color, HPDF_↔ RGBColor background)

Set the table title style.

- int `hpdftbl_set_cell` (`hpdftbl_t` t, int r, int c, char *label, char *content)

Set content for specific cell.

- int `hpdftbl_set_tag` (`hpdftbl_t` t, void *tag)

Set an optional tag for the table.

- int `hpdftbl_set_title` (`hpdftbl_t` t, char *title)

Set table title.

- int `hpdftbl_set_title_halign` (`hpdftbl_t` t, `hpdftbl_text_align_t` align)

Set horizontal alignment for table title.

- int `hpdftbl_set_labels` (`hpdftbl_t` t, char **labels)

Set the text for the cell labels.

- int `hpdftbl_set_content` (`hpdftbl_t` t, char **content)

- Set the content for the table.*

 - int `hpdftbl_set_content_cb` (`hpdftbl_t` t, `hpdftbl_content_callback_t` cb)

Set table content callback.
- int `hpdftbl_set_cell_content_cb` (`hpdftbl_t` t, `size_t` r, `size_t` c, `hpdftbl_content_callback_t` cb)

Set cell content callback.
- int `hpdftbl_set_cell_content_style_cb` (`hpdftbl_t` t, `size_t` r, `size_t` c, `hpdftbl_content_style_callback_t` cb)

Set cell specific callback to specify cell content style.
- int `hpdftbl_set_content_style_cb` (`hpdftbl_t` t, `hpdftbl_content_style_callback_t` cb)

Set callback to specify cell content style.
- int `hpdftbl_set_label_cb` (`hpdftbl_t` t, `hpdftbl_content_callback_t` cb)

Set table label callback.
- int `hpdftbl_set_cell_label_cb` (`hpdftbl_t` t, `size_t` r, `size_t` c, `hpdftbl_content_callback_t` cb)

Set cell label callback.
- int `hpdftbl_set_canvas_cb` (`hpdftbl_t` t, `hpdftbl_canvas_callback_t` cb)

Set cell canvas callback.
- int `hpdftbl_set_cell_canvas_cb` (`hpdftbl_t` t, `size_t` r, `size_t` c, `hpdftbl_canvas_callback_t` cb)

Set cell canvas callback.
- void `hpdftbl_set_text_encoding` (char *target, char *source)

Determine text source encoding.
- int `hpdftbl_encoding_text_out` (HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, char *text)

Strike text with current encoding.
- void `HPDF_RoundedCornerRectangle` (HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, HPDF_REAL rad)

Draw rectangle with rounded corner.
- void `hpdftbl_stroke_grid` (HPDF_Doc pdf, HPDF_Page page)
- void `hpdftbl_table_widget_letter_buttons` (HPDF_Doc doc, HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, HPDF_RGBColor on_color, HPDF_RGBColor off_color, HPDF_RGBColor on_background, HPDF_RGBColor off_background, HPDF_REAL fsize, const char *letters, _Bool *state)

Display an array of letters as a table where each letter is its own "mini" cell and surrounded by a frame. Each boxed letter can be in an "on" state or "off" state which is illustrated with different font and fac colors.
- void `hpdftbl_widget_slide_button` (HPDF_Doc doc, HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, _Bool state)

Table widget that draws a sliding on/off switch. Meant to be used in a canvas callback to display a boolean value.
- void `hpdftbl_widget_hbar` (HPDF_Doc doc, HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, HPDF_RGBColor color, float val, _Bool hide_val)

Draw a horizontal partially filled bar to indicate an analog (percentage) value.
- void `hpdftbl_widget_segment_hbar` (HPDF_Doc doc, HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, `size_t` num_segments, HPDF_RGBColor on_color, double val_percent, _Bool hide_val)

Draw a horizontal segment meter that can be used to visualize a discrete value.
- void `hpdftbl_widget_strength_meter` (HPDF_Doc doc, HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, `size_t` num_segments, HPDF_RGBColor on_color, `size_t` num_on_segments)

Draw a phone strength meter.

Variables

- int `hpdftbl_err_code`

Stores the last generated error code.
- int `hpdftbl_err_row`

The row where the last error was generated.

- `int hpdfctl_err_col`

The column where the last error was generated.

15.7.1 Detailed Description

Header file for libhpdfctl.

15.7.2 Macro Definition Documentation

15.7.2.1 `_HPDFCTL_SET_ERR`

```
#define _HPDFCTL_SET_ERR(  
    t,  
    err,  
    r,  
    c ) do {hpdfctl_err_code=err;hpdfctl_err_row=r;hpdfctl_err_col=c; if(hpdfctl_err_handler){hpdfctl_err_handler(t,r,c,err);}} while(0)
```

Call the error handler with specified error code and table row, col where error occurred.

Parameters

<i>t</i>	Table handler
<i>err</i>	Error code
<i>r</i>	Row where error occurred
<i>c</i>	Column where error occurred

15.7.2.2 DEFAULT_AUTO_VBOTTOM_MARGIN_FACTOR

```
#define DEFAULT_AUTO_VBOTTOM_MARGIN_FACTOR 0.5
```

The margin from the bottom of the cell to the baseline of the text is calculated as a fraction of the font size.

The margin is calculated as:

```
bottom_margin = fontsize * AUTO_VBOTTOM_MARGIN_FACTOR
```

See also

[hpdftbl_set_bottom_vmargin_bottom\(\)](#)

15.7.2.3 hpdftbl_cm2dpi

```
#define hpdftbl_cm2dpi(  
    c ) ((HPDF_REAL) (c)) / 2.54 * 72)
```

Convert cm to dots using the default resolution (72 DPI)

Parameters

<i>cm</i>	Measure in cm
-----------	---------------

Returns

HPDF_REAL Converted value in dots

Examples

[example01.c](#), [tut_ex01.c](#), [tut_ex02.c](#), [tut_ex02_1.c](#), [tut_ex03.c](#), [tut_ex04.c](#), [tut_ex05.c](#), [tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), [tut_ex09.c](#), [tut_ex10.c](#), [tut_ex11.c](#), [tut_ex12.c](#), [tut_ex13_1.c](#), [tut_ex13_2.c](#), [tut_ex14.c](#), and [tut_ex20.c](#).

15.7.3 Typedef Documentation

15.7.3.1 `hpdf_text_style_t`

```
typedef struct text_style hpdf_text_style_t
```

Specification of a text style.

This structure collects the basic properties for a text string (font, color, background, horizontal alignment)

15.7.3.2 `hpdftbl_callback_t`

```
typedef void(* hpdftbl_callback_t) (hpdftbl_t)
```

Callback type for optional post processing when constructing table from a data array.

Type for generic table callback used when constructing a table from data. This can be used to perform any potential table manipulation. The callback happens after the table has been fully constructed and just before it is stroked.

See also

[`hpdftbl_stroke_from_data\(\)`](#)

15.7.3.3 `hpdftbl_canvas_callback_t`

```
typedef void(* hpdftbl_canvas_callback_t) (HPDF_Doc, HPDF_Page, void *, size_t, size_t, HPDF_REAL, HPDF_REAL, HPDF_REAL, HPDF_REAL)
```

Type specification for the table canvas callback.

A canvas callback, if specified, is called for each cell before the content is stroked. The callback will be given the bounding box for the cell (x,y,width,height) in addition to the row and column the cell has.

See also

[`hpdftbl_set_canvas_callback\(\)`](#)

15.7.3.4 `hpdftbl_cell_spec_t`

```
typedef struct hpdftbl_cell_spec hpdftbl_cell_spec_t
```

Used in data driven table creation.

A table can be specified by creating a array of this structure together with the `hpdftbl_spec_t` structure. The array should have one entry for each cell in the table.

See also

[`hpdftbl_stroke_from_data\(\)`](#)

15.7.3.5 hpdftbl_cell_t

```
typedef struct hpdftbl_cell hpdftbl_cell_t
```

Type definition for the cell structure.

This is an internal structure that represents an individual cell in the table.

15.7.3.6 hpdftbl_content_callback_t

```
typedef char *(* hpdftbl_content_callback_t) (void *, size_t, size_t)
```

Type specification for the table content callback.

The content callback is used to specify the textual content in a cell and is an alternative method to specifying the content to be displayed.

See also

`hpdftbl_set_content_callback()`

15.7.3.7 hpdftbl_content_style_callback_t

```
typedef _Bool(* hpdftbl_content_style_callback_t) (void *, size_t, size_t, char *content, hpdf_text_style_t *)
```

Type specification for the content style.

The content callback is used to specify the textual style in a cell and is an alternative method to specifying the style of content to be displayed.

See also

`hpdftbl_set_content_style_callback()`

15.7.3.8 hpdftbl_error_handler_t

```
typedef void(* hpdftbl_error_handler_t) (hpdftbl_t, int, int, int)
```

Type for error handler function.

The error handler (of set) will be called if the table library discovers an error condition

See also

`hpdftbl_set_errhandler()`

15.7.3.9 `hpdfctl_grid_style_t`

```
typedef struct grid_style hpdfctl_grid_style_t
```

Specification for table grid lines.

Contains line properties used when stroking a grid line

15.7.3.10 `hpdfctl_line_dashstyle_t`

```
typedef enum hpdfctl_dashstyle hpdfctl_line_dashstyle_t
```

Possible line dash styles for grid lines.

In the illustration of the patterns "x"=solid and "_"=space.

For each pattern we show two full cycles which should give a good visual indication of the different patterns.

15.7.3.11 `hpdfctl_spec_t`

```
typedef struct hpdfctl_spec hpdfctl_spec_t
```

Used in data driven table creation.

This is used together with an array of cell specification `hpdfctl_cell_spec_t` to specify the layout of a table.

15.7.3.12 `hpdfctl_t`

```
typedef struct hpdfctl* hpdfctl_t
```

Table handle is a pointer to the `hpdfctl` structure.

This is the basic table handle used in almost all API calls. A table reference is returned when a table is created.

See also

[hpdfctl_create\(\)](#)

15.7.3.13 `hpdfctl_text_align_t`

```
typedef enum hpdfctl_text_align hpdfctl_text_align_t
```

Enumeration for horizontal text alignment.

See also

[hpdfctl_set_header_halign\(\)](#)

[hpdfctl_set_title_halign\(\)](#)

[hpdfctl_text_align](#)

15.7.3.14 hpdftbl_theme_t

```
typedef struct hpdftbl_theme hpdftbl_theme_t
```

Define a set of styles into a table theme.

Contains all information about the styles of various elements in the table that together make up the table style

15.7.4 Enumeration Type Documentation

15.7.4.1 hpdftbl_dashstyle

```
enum hpdftbl_dashstyle
```

Possible line dash styles for grid lines.

In the illustration of the patterns "x"=solid and "_"=space.

For each pattern we show two full cycles which should give a good visual indication of the different patterns.

Enumerator

LINE_SOLID	Solid line
LINE_DOT1	Dotted line variant 1 "x_x_x_"
LINE_DOT2	Dotted line variant 2 "x_x_x_x_"
LINE_DOT3	Dotted line variant 3 "x_x_x_x_x_"
LINE_DASH1	Dashed line variant 1 "xx_xx_xx_"
LINE_DASH2	Dashed line variant 2 "xx_xx_xx_x_"
LINE_DASH3	Dashed line variant 3 "xxxx_xxxx_xxxx_"
LINE_DASH4	Dashed line variant 4 "xxxx_xxxx_xxxx_x_"
LINE_DASHDOT1	Dashed-dot line variant 1 "xxxxx_xx_xxxxx_xx_xxxxx_xx_"
LINE_DASHDOT2	Dashed-dot line variant 1 "xxxxxxx_xxx_xxxxxxxx_xxx_xxxxxxxx_xxx_"

15.7.4.2 hpdftbl_text_align

```
enum hpdftbl_text_align
```

Enumeration for horizontal text alignment.

See also

[hpdftbl_set_header_halign\(\)](#)

[hpdftbl_set_title_halign\(\)](#)

[hpdftbl_text_align](#)

Enumerator

LEFT	Left test alignment
CENTER	Center test alignment
RIGHT	Right test alignment

15.7.5 Function Documentation

15.7.5.1 HPDF_RoundedCornerRectangle()

```
void HPDF_RoundedCornerRectangle (
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    HPDF_REAL width,
    HPDF_REAL height,
    HPDF_REAL rad )
```

Draw rectangle with rounded corner.

Draw a rectangle with rounded corner with the current line width, color. The rectangle will not be stroked.

Parameters

<i>page</i>	Page handle
<i>xpos</i>	Lower left x-position of rectangle
<i>ypos</i>	Lower left y-position of rectangle
<i>width</i>	Width of rectangle
<i>height</i>	Height of rectangle
<i>rad</i>	Radius of corners

Referenced by [hpdfctl_widget_slide_button\(\)](#).

15.7.5.2 hpdfctl_apply_theme()

```
int hpdfctl_apply_theme (
    hpdfctl_t t,
    hpdfctl_theme_t * theme )
```

Apply a specified theme to a table.

The default table theme can be retrieved with [hpdfctl_get_default_theme\(\)](#)

Parameters

<i>t</i>	Table handle
<i>theme</i>	Theme reference

Returns

0 on success, -1 on failure

See also

[hpdftbl_get_default_theme\(\)](#)

15.7.5.3 hpdftbl_clear_spanning()

```
int hpdftbl_clear_spanning (
    hpdftbl_t t )
```

Clear all cell spanning.

Reset all spanning cells to no spanning

Parameters

<i>t</i>	Table handle
----------	--------------

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_cellspan\(\)](#)

15.7.5.4 hpdftbl_create()

```
hpdftbl_t hpdftbl_create (
    size_t rows,
    size_t cols )
```

Create a new table with no title.

Create a new table structure. This is the basic handler needed for most other API functions.

Parameters

<i>rows</i>	Number of rows
<i>cols</i>	Number of columns

Returns

A handle to a table, NULL in case of OOM

15.7.5.5 hpdftbl_create_title()

```
hpdftbl_t hpdftbl_create_title (
    size_t rows,
    size_t cols,
    char * title )
```

Create a new table with title top row.

Create a new table structure. This is the basic handler needed for most other API functions.

Parameters

<i>rows</i>	Number of rows
<i>cols</i>	Number of columns
<i>title</i>	Title of table

Returns

A handle to a table, NULL in case of OOM

Referenced by [hpdftbl_create\(\)](#), and [hpdftbl_stroke_from_data\(\)](#).

15.7.5.6 hpdftbl_default_table_error_handler()

```
void hpdftbl_default_table_error_handler (
    hpdftbl_t t,
    int r,
    int c,
    int err )
```

A basic default table error handler.

This error handler is used as a callback that outputs the error to stderr in human readable format and quits the process.

Parameters

<i>t</i>	Table where the error happened (can be NULL)
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>err</i>	The error code

See also

[hpdftbl_set_errhandler\(\)](#)**15.7.5.7 hpdftbl_destroy()**

```
int hpdftbl_destroy (
    hpdftbl_t t )
```

Destroy a table and free all memory.

Destroy a table previous created with `table_create()`, It is the calling routines responsibility not to access `t` again.

Parameters

<i>t</i>	Handle to table
----------	-----------------

Returns

0 on success, -1 on failure

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.8 hpdftbl_destroy_theme()

```
int hpdftbl_destroy_theme (
    hpdftbl_theme_t * theme )
```

Destroy existing theme structure and free memory.

Free all memory allocated by a theme

Parameters

<i>theme</i>	The theme to free
--------------	-------------------

Returns

-1 for error , 0 for success

Examples

[example01.c](#).

Referenced by [hpdfdbl_create_title\(\)](#).

15.7.5.9 hpdfdbl_encoding_text_out()

```
int hpdfdbl_encoding_text_out (
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    char * text )
```

Stroke text with current encoding.

Utility function to stroke text with character encoding. It is the calling routines responsibility to enclose text in a HPDF_Page_BeginText() / HPDF_Page_EndText()

Parameters

<i>page</i>	Page handle
<i>xpos</i>	X coordinate
<i>ypos</i>	Y coordinate
<i>text</i>	Text to print

Returns

-1 on error, 0 on success

15.7.5.10 hpdfdbl_get_anchor_top_left()

```
_Bool hpdfdbl_get_anchor_top_left (
    void )
```

Get stroking anchor point.

Get anchor point for table positioning. By default the top left is used.

See also

[hpdfdbl_set_anchor_top_left](#)

Returns

TRUE if anchor is top left, FALSE otherwise

15.7.5.11 hpdftbl_get_default_theme()

```
hpdftbl_theme_t * hpdftbl_get_default_theme (
    void )
```

Return the default theme.

Create and return a theme corresponding to the default table theme. It is the calling functions responsibility to call [hpdftbl_destroy_theme\(\)](#) to free the allocated memory. The default theme is a good starting point to just make minor modifications without having to define all elements.

Returns

A new theme initialized to the default settings

See also

[hpdftbl_apply_theme\(\)](#)

Examples

[example01.c](#).

Referenced by [hpdftbl_create_title\(\)](#).

15.7.5.12 hpdftbl_get_errstr()

```
const char * hpdftbl_get_errstr (
    int err )
```

Translate a table error code to a human readable string.

The function returns a pointer to a static string that cannot be modified. It will translate both internal table error messages as well as generic HPDF library error codes.

Parameters

<i>err</i>	The error code to be translated
------------	---------------------------------

Returns

Static pointer to string for valid error code, NULL otherwise

See also

[hpdftbl_hpdl_get_errstr\(\)](#)

Referenced by [hpdftbl_default_table_error_handler\(\)](#), and [hpdftbl_get_last_errcode\(\)](#).

15.7.5.13 `hpdftbl_get_last_auto_height()`

```
int hpdftbl_get_last_auto_height (
    HPDF_REAL * height )
```

Get the height calculated for the last constructed table.

Get the last automatically calculated height when stroking a table. (The height will be automatically calculated if it was specified as 0)

Parameters

<i>height</i>	Returned height
---------------	-----------------

Returns

-1 on error, 0 if successful

15.7.5.14 `hpdftbl_get_last_errcode()`

```
int hpdftbl_get_last_errcode (
    const char ** errstr,
    int * row,
    int * col )
```

Return last error code.

Return last error code. if *errstr* is not NULL a human readable string describing the error will be copied to the string. The error code will be reset after call.

Parameters

<i>errstr</i>	A string buffer where the error string is written to
<i>row</i>	The row where the error was found
<i>col</i>	The col where the error was found

Returns

The last error code

15.7.5.15 `hpdftbl_hpdf_get_errstr()`

```
const char * hpdftbl_hpdf_get_errstr (
    const HPDF_STATUS err_code )
```

Function to return a human readable error string for an error code from Core HPDF library.

The various error codes given by the HPDF library can be translated back to a string by the usage of this function. The function will return a pointer to a static string that can not be manipulated.

Parameters

<i>err_code</i>	The error code
-----------------	----------------

Returns

A pointer to an error string, NULL if the error code is invalid

See also

[hpdftbl_get_errstr\(\)](#)

Examples

[example01.c](#), [tut_ex01.c](#), [tut_ex02.c](#), [tut_ex02_1.c](#), [tut_ex03.c](#), [tut_ex04.c](#), [tut_ex05.c](#), [tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), [tut_ex09.c](#), [tut_ex10.c](#), [tut_ex11.c](#), [tut_ex12.c](#), [tut_ex13_1.c](#), [tut_ex13_2.c](#), [tut_ex14.c](#), and [tut_ex20.c](#).

15.7.5.16 hpdftbl_set_anchor_top_left()

```
void hpdftbl_set_anchor_top_left (
    const _Bool anchor )
```

Switch stroking anchor point.

Set anchor point for table positioning. By default the top left is used as anchor. Calling this function with FALSE can sets the anchor to bottom left instead.

Parameters

<i>anchor</i>	Set to TRUE to use top left as anchor, FALSE for bottom left
---------------	--

15.7.5.17 hpdftbl_set_background()

```
int hpdftbl_set_background (
    hpdftbl_t t,
    HPDF_RGBColor background )
```

Set table background color.

Parameters

<i>t</i>	Table handle
<i>background</i>	Background color

Returns

0 on success, -1 on failure

15.7.5.18 hpdfdbl_set_bottom_vmargin_bottom()

```
void hpdfdbl_set_bottom_vmargin_bottom (
    hpdfdbl_t t,
    HPDF_REAL f )
```

The margin from the bottom of the cell to the baseline of the text is calculated as a fraction of the font size. The margin is calculated as:

```
bottom_margin = fontsize * f
```

The default margin is specified by the define [DEFAULT_AUTO_VBOTTOM_MARGIN_FACTOR](#)

Parameters

<i>t</i>	Table handle
<i>f</i>	Bottom margin factor

15.7.5.19 hpdfdbl_set_canvas_cb()

```
int hpdfdbl_set_canvas_cb (
    hpdfdbl_t t,
    hpdfdbl_canvas_callback_t cb )
```

Set cell canvas callback.

Set cell canvas callback. This callback gets called for each cell in the table. The purpose is to allow the client to add dynamic content to the specified cell. The callback is made before the cell border and content is drawn making it possible to for example add a background color to individual cells. The callback function will receive the Table tag, the row and column, the x, y position of the lower left corner of the table and the width and height of the cell. To set the canvas callback only for a sepcific cell use the [hpdfdbl_set_cell_canvas_callback\(\)](#) function

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

-1 on failure, 0 otherwise

See also

[hpdfdbl_set_cell_canvas_cb\(\)](#)

15.7.5.20 hpdftbl_set_cell()

```
int hpdftbl_set_cell (
    hpdftbl_t t,
    int r,
    int c,
    char * label,
    char * content )
```

Set content for specific cell.

Set label and content for a specific cell. If the specified cell is part of another cells spanning an error occurs (returns -1),

Parameters

<i>t</i>	Table handle
<i>r</i>	Row
<i>c</i>	Column
<i>label</i>	Label
<i>content</i>	Text content

Returns

-1 on error, 0 if successful

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.21 hpdftbl_set_cell_canvas_cb()

```
int hpdftbl_set_cell_canvas_cb (
    hpdftbl_t t,
    size_t r,
    size_t c,
    hpdftbl_canvas_callback_t cb )
```

Set cell canvas callback.

Set a canvas callback for an individual cell. This will override the table canvas callback. The canvas callback is called with arguments that give the bounding box for the cell. In that way a callback function may draw arbitrary graphic in the cell. The callback is made before the cell border and content is drawn making it possible to for example add a background color to individual cells. The callback function will receive the Table tag, the row and column, the x, y position of the lower left corner of the table and the width and height of the cell.

Parameters

<i>t</i>	Table handle
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>cb</i>	Callback function

Returns

-1 on failure, 0 otherwise

See also

15.7.5.22 hpdfdbl_set_cell_content_cb()

```
int hpdfdbl_set_cell_content_cb (
    hpdfdbl_t t,
    size_t r,
    size_t c,
    hpdfdbl_content_callback_t cb )
```

Set cell content callback.

Set a content callback for an individual cell. This will override the table content callback. The callback function will receive the Table tag and the row and column for the cell the callback is made for.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function
<i>r</i>	Cell row
<i>c</i>	Cell column

Returns

-1 on failure, 0 otherwise

See also

[hpdfdbl_set_content_cb\(\)](#)

Referenced by [hpdfdbl_stroke_from_data\(\)](#).

15.7.5.23 hpdfdbl_set_cell_content_style()

```
int hpdfdbl_set_cell_content_style (
    hpdfdbl_t t,
    size_t r,
```

```

    size_t c,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )

```

Set the font style for content of specified cell.

SSet the font style for content of specified cell. This will override the global cell content setting.

Parameters

<i>t</i>	Table handle
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

15.7.5.24 hpdftbl_set_cell_content_style_cb()

```

int hpdftbl_set_cell_content_style_cb (
    hpdftbl_t t,
    size_t r,
    size_t c,
    hpdftbl_content_style_callback_t cb )

```

Set cell specific callback to specify cell content style.

Set callback to format the style for the specified cell

Parameters

<i>t</i>	Table handle
<i>r</i>	Cell row
<i>c</i>	Cell column
<i>cb</i>	Callback function

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_ontent_style_cb\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.25 hpdftbl_set_cell_label_cb()

```
int hpdftbl_set_cell_label_cb (
    hpdftbl_t t,
    size_t r,
    size_t c,
    hpdftbl_content_callback_t cb )
```

Set cell label callback.

Set a label callback for an individual cell. This will override the table label callback. The callback function will receive the Table tag and the row and column for the cell the callback is made for.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function
<i>r</i>	Cell row
<i>c</i>	Cell column

Returns

-1 on failure, 0 otherwise

See also

[hpdftbl_set_label_cb\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.26 hpdftbl_set_cellspan()

```
int hpdftbl_set_cellspan (
    hpdftbl_t t,
    size_t r,
    size_t c,
    size_t rowspan,
    size_t colspan )
```

Set cell spanning.

Set row and column spanning for a cell, an expanded cell is referenced via the position of it's top-left cell

Parameters

<i>t</i>	Table handle
<i>r</i>	Row
<i>c</i>	Column
<i>rowspan</i>	Row span
<i>colspan</i>	Column span

Returns

-1 on error, 0 if successful

See also

[hpdftbl_clear_spanning\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.27 hpdftbl_set_col_content_style()

```
int hpdftbl_set_col_content_style (
    hpdftbl_t t,
    size_t c,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the font style for an entire column of cells.

Set font options for the specified column of cells. This will override the global cell content setting.

Parameters

<i>t</i>	Table handle
<i>c</i>	Column to affect
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_content_style\(\)](#)

[hpdftbl_set_cell_content_style_cb\(\)](#)

15.7.5.28 hpdftbl_set_colwidth_percent()

```
int hpdftbl_set_colwidth_percent (
    hpdftbl_t t,
    size_t c,
    float w )
```

Set column width as percentage of overall table width.

Specify column width as percentage of total column width. Note that this will only take effect if the table has an overall width specified when stroked. Too avoid errors one column should be left unspecified to let the library use whatever space is left for that column.

Parameters

<i>t</i>	Table handle
<i>c</i>	Column to set width of first column has index 0
<i>w</i>	Width as percentage in range [0.0, 100.0]

Returns

0 on success, -1 on failure

15.7.5.29 hpdftbl_set_content()

```
int hpdftbl_set_content (
    hpdftbl_t t,
    char ** content )
```

Set the content for the table.

Set content for all cells. It is the calling functions responsibility that the content array is big enough to cover the entire table. The string array corresponds to a flattened 2-d array and the label for cell (r,c) is calculated as (r * num_cols + c) where num_cols is the number of columns in the table.

It is allowed to specify NULL as placeholder for empty labels. The actual text in the table will be allocated with `strdup()` so it is safe to free the memory for the labels after the call to this function. Please note that even if the table contains spanning cells the content data must include empty data for covered cells. For a N x M table the data must have (N*M) entries.

Another way to specify the content is to use the callback mechanism. By setting up a content callback function that returns the content for a cell.

Parameters

<i>t</i>	Table handle
<i>content</i>	A one dimensional string array of content string

Returns

-1 on error, 0 if successful

See also

[hpdftbl_set_content_callback\(\)](#)

[hpdftbl_set_cell_content_callback\(\)](#)

15.7.5.30 hpdftbl_set_content_cb()

```
int hpdftbl_set_content_cb (
    hpdftbl_t t,
    hpdftbl_content_callback_t cb )
```

Set table content callback.

This callback gets called for each cell in the table and the returned string will be used as the content. The string will be duplicated so it is safe for a client to reuse the string space. If NULL is returned from the callback then the content will be set to the content specified with the direct content setting. The callback function will receive the Table tag and the row and column for the cell the callback is made for.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

-1 for error , 0 otherwise

See also

[hpdftbl_set_cell_content_cb\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.31 `hpdftbl_set_content_style()`

```
int hpdftbl_set_content_style (
    hpdftbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set style for text content.

Set style options for cell content (font, color, background). This will be applied for all cells in the table. If a style callback have been specified for either the table or a cell that style take precedence.

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

-1 on error, 0 if successful

See also

[hpdftbl_set_cell_content_style\(\)](#)
[hpdftbl_set_cell_content_style_cb\(\)](#)

Referenced by [hpdftbl_apply_theme\(\)](#).

15.7.5.32 `hpdftbl_set_content_style_cb()`

```
int hpdftbl_set_content_style_cb (
    hpdftbl_t t,
    hpdftbl_content_style_callback_t cb )
```

Set callback to specify cell content style.

Set callback to format the style for cells in the table. If a cell has its own content style callback that callback will override the generic table callback.

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_cell_content_style_cb\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.33 hpdftbl_set_errhandler()

```
hpdftbl_error_handler_t hpdftbl_set_errhandler (  
    hpdftbl_error_handler_t err_handler )
```

Specify errhandler for the table routines.

Note: The library provides a basic default error handler that can be used,

Parameters

<i>err_handler</i>	
--------------------	--

Returns

The old error handler or NULL if non exists

See also

[hpdftbl_default_table_error_handler\(\)](#)

15.7.5.34 hpdftbl_set_header_halign()

```
int hpdftbl_set_header_halign (  
    hpdftbl_t t,  
    hpdftbl_text_align_t align )
```

Set table header horizontal text align.

Parameters

<i>t</i>	Table handle
<i>align</i>	Alignment

Returns

0 on success, -1 on failure

Referenced by [hpdftbl_apply_theme\(\)](#).

15.7.5.35 hpdftbl_set_header_style()

```
int hpdftbl_set_header_style (
    hpdftbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Specify style for table header row.

Set the font properties and background for the header row which is the top row if enabled. The header row will be automatically enabled after calling this function. The header can be enabled/disabled separately with [hpdftbl_use_header\(\)](#)

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Font color
<i>background</i>	Cell background color

Returns

0 on success, -1 on failure

See also

[hpdftbl_use_header\(\)](#)

Referenced by [hpdftbl_apply_theme\(\)](#).

15.7.5.36 hpdftbl_set_inner_grid_style()

```
int hpdftbl_set_inner_grid_style (
    hpdftbl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdftbl_line_dashstyle_t dashstyle )
```

Set inner border grid style.

This is a shortform to set both the vertical and horizontal gridline style with one call.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_inner_hgrid_style\(\)](#), [hpdftbl_set_inner_vgrid_style\(\)](#), [hpdftbl_set_outer_grid_style\(\)](#)

15.7.5.37 hpdftbl_set_inner_hgrid_style()

```
int hpdftbl_set_inner_hgrid_style (
    hpdftbl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdftbl_line_dashstyle_t dashstyle )
```

Set inner horizontal border grid style.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_inner_grid_style\(\)](#), [hpdftbl_set_inner_vgrid_style\(\)](#)

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_set_inner_grid_style\(\)](#).

15.7.5.38 `hpdfctl_set_inner_tgrid_style()`

```
int hpdfctl_set_inner_tgrid_style (
    hpdfctl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdfctl_line_dashstyle_t dashstyle )
```

Set inner horizontal top border grid style.

This would be the gridline just below the header row.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdfctl_set_inner_hgrid_style\(\)](#)

Referenced by [hpdfctl_apply_theme\(\)](#).

15.7.5.39 `hpdfctl_set_inner_vgrid_style()`

```
int hpdfctl_set_inner_vgrid_style (
    hpdfctl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdfctl_line_dashstyle_t dashstyle )
```

Set inner vertical border grid style.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_inner_grid_style\(\)](#), [hpdftbl_set_inner_hgrid_style\(\)](#)

Referenced by [hpdftbl_apply_theme\(\)](#), and [hpdftbl_set_inner_grid_style\(\)](#).

15.7.5.40 hpdftbl_set_label_cb()

```
int hpdftbl_set_label_cb (
    hpdftbl_t t,
    hpdftbl_content_callback_t cb )
```

Set table label callback.

Set label callback. This callback gets called for each cell in the table and the returned string will be used as the label. The string will be duplicated so it is safe for a client to reuse the string space. If NULL is returned from the callback then the label will be set to the content specified with the direct label setting. The callback function will receive the Table tag and the row and column

Parameters

<i>t</i>	Table handle
<i>cb</i>	Callback function

Returns

-1 on failure, 0 otherwise

See also

[hpdftbl_content_callback_t](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.41 hpdftbl_set_label_style()

```
int hpdftbl_set_label_style (
    hpdftbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the style for labels in the entire table.

Set font, color and background options for cell labels. If a style callback have been specified for either the table or a cell that style take precedence.

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

-1 on error, 0 if successful

Referenced by [hpdftbl_apply_theme\(\)](#).

15.7.5.42 hpdftbl_set_labels()

```
int hpdftbl_set_labels (
    hpdftbl_t t,
    char ** labels )
```

Set the text for the cell labels.

Set labels for all the cell. It is the calling functions responsibility that the labels array is big enough to cover the entire table. The string array corresponds to a flattened 2-d array and the label for cell (r,c) is calculated as (r * num_cols + c) where num_cols is the number of columns in the table.

It is allowed to specify NULL as placeholder for empty labels. The actual text in the table will be allocated with `strdup()` so it is safe to free the memory for the labels after the call to this function. Please note that even if the table contains spanning cells the content data must include empty data for covered cells. For a N x M table the data must have (N*M) entries.

Parameters

<i>t</i>	Table handle
<i>labels</i>	A one dimensional string array of labels

Returns

-1 on error, 0 if successful

See also

[hpdftbl_set_cell_label_cb\(\)](#)

[hpdftbl_set_label_cb\(\)](#)

15.7.5.43 hpdftbl_set_min_rowheight()

```
int hpdftbl_set_min_rowheight (
    hpdftbl_t t,
    float h )
```

Set the minimum row height in the table.

The row height is normally calculated based on the font size and if labels are displayed or not. However, it is not possible for the table to know the height of specific widgets (for example) without a two-pass table drawing algorithm.

To handle those odd cases when the calculated height is not sufficient a manual minimum height can be specified.

Parameters

<i>t</i>	Table handler
<i>h</i>	The minimum height (in points). If specified as 0 the min height will have no effect.

Returns

0 on success, -1 on failure

15.7.5.44 hpdftbl_set_outer_grid_style()

```
int hpdftbl_set_outer_grid_style (
    hpdftbl_t t,
    HPDF_REAL width,
    HPDF_RGBColor color,
    hpdftbl_line_dashstyle_t dashstyle )
```

Set outer border grid style.

Parameters

<i>t</i>	Table handle
<i>width</i>	Line width (in pt)
<i>color</i>	Line color
<i>dashstyle</i>	Line dash style

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_inner_grid_style\(\)](#)

Referenced by [hpdftbl_apply_theme\(\)](#).

15.7.5.45 `hpdftbl_set_row_content_style()`

```
int hpdftbl_set_row_content_style (
    hpdftbl_t t,
    size_t r,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the style for an entire row of cells.

Set font options for the specified row of cells. This will override the global cell content.

Parameters

<i>t</i>	Table handle
<i>r</i>	Row to affect
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_content_style\(\)](#)

[hpdftbl_set_cell_content_style_cb\(\)](#)

15.7.5.46 `hpdftbl_set_tag()`

```
int hpdftbl_set_tag (
    hpdftbl_t t,
    void * tag )
```

Set an optional tag for the table.

Set an optional tag in the table. The tag can be a pointer to anything. The tag is passed as the first argument in the various callbacks and can be used to supply table specific information or identify a specific table in the case the same callback is used for multiple tables.

Parameters

<i>t</i>	The table handle
<i>tag</i>	The tag (pointer to any object)

Returns

0 on success, -1 on failure

15.7.5.47 hpdftbl_set_text_encoding()

```
void hpdftbl_set_text_encoding (
    char * target,
    char * source )
```

Determine text source encoding.

The default HPDF encoding is a standard PDF encoding. The problem with that is that now almost 100% of all code is written in UTF-8 encoding and trying to print text strings with accented characters will simply not work. For example the default encoding assumes that strings are given in UTF-8 and sets the target to ISO8859-4 which includes northern europe accented characters. The conversion is internally handled by the standard `iconv()` routines.

Parameters

<i>target</i>	The target encoding. See HPDF documentation for supported encodings.
<i>source</i>	The source encodings, i.e. what encodings are sth strings in the source specified in.

15.7.5.48 hpdftbl_set_title()

```
int hpdftbl_set_title (
    hpdftbl_t t,
    char * title )
```

Set table title.

Set table title. A title will occupy a separate row above the table that is not included in the row count. A table is enabled when the table text is `<> NULL` and disabled when the title text is `== NULL`.

Parameters

<i>t</i>	Table handle
<i>title</i>	Title string

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_title_style\(\)](#)

[hpdftbl_set_title_halign\(\)](#)

15.7.5.49 `hpdfdbl_set_title_halign()`

```
int hpdfdbl_set_title_halign (
    hpdfdbl_t t,
    hpdfdbl_text_align_t align )
```

Set horizontal alignment for table title.

Parameters

<i>t</i>	Table handle
<i>align</i>	Alignment

Returns

0 on success, -1 on failure

See also

[hpdfdbl_set_title\(\)](#)

[hpdfdbl_set_title_style\(\)](#)

Referenced by [hpdfdbl_apply_theme\(\)](#).

15.7.5.50 `hpdfdbl_set_title_style()`

```
int hpdfdbl_set_title_style (
    hpdfdbl_t t,
    char * font,
    HPDF_REAL fsize,
    HPDF_RGBColor color,
    HPDF_RGBColor background )
```

Set the table title style.

Set font options for title

Parameters

<i>t</i>	Table handle
<i>font</i>	Font name
<i>fsize</i>	Font size
<i>color</i>	Color
<i>background</i>	Background color

Returns

0 on success, -1 on failure

See also

[hpdftbl_set_title\(\)](#)

[hpdftbl_set_title_halign\(\)](#)

Referenced by [hpdftbl_apply_theme\(\)](#).

15.7.5.51 hpdftbl_stroke()

```
int hpdftbl_stroke (
    HPDF_Doc pdf,
    const HPDF_Page page,
    hpdftbl_t t,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
    HPDF_REAL height )
```

Stroke the table.

Stroke the table at the specified position and size. The position is by default specified as the upper left corner of the table. Use the [hpdftbl_set_origin_top_left\(FALSE\)](#) to use the bottom left of the table as reference point.

Parameters

<i>pdf</i>	The HPDF document handle
<i>page</i>	The HPDF page handle
<i>t</i>	Table handle
<i>xpos</i>	x position for table, bottom left corner
<i>ypos</i>	y position for table, bottom left corner
<i>width</i>	width of table
<i>height</i>	height of table. If the height is specified as 0 it will be automatically calculated. The calculated height can be retrieved after the table has been stroked by a call to hpdftbl_get_last_auto_height()

Returns

-1 on error, 0 if successful

See also

[hpdftbl_get_last_auto_height\(\)](#)

[hpdftbl_stroke_from_data\(\)](#)

Referenced by [hpdftbl_stroke_from_data\(\)](#).

15.7.5.52 `hpdftbl_stroke_from_data()`

```
int hpdftbl_stroke_from_data (
    HPDF_Doc pdf_doc,
    HPDF_Page pdf_page,
    hpdftbl_spec_t * tbl_spec,
    hpdftbl_theme_t * theme )
```

Construct the table from a array specification.

Create and stroke a table specified by a data structure. This makes it easier to separate the view of the data from the model which provides the data. The intended use case is that the data structure specifies the core layout of the table together with the labels and callback functions to handle the content in each cell. Using this method to create a table also makes it much more maintainable.

Parameters

<i>pdf_doc</i>	The PDF overall document
<i>pdf_page</i>	The pageto stroke to
<i>tbl_spec</i>	The table specification
<i>theme</i>	Table theme to be applied

Returns

0 on success, -1 on failure

See also

[hpdftbl_stroke\(\)](#)

15.7.5.53 `hpdftbl_stroke_grid()`

```
void hpdftbl_stroke_grid (
    HPDF_Doc pdf,
    HPDF_Page page )
```

Stroke a point grid on specified page to make it easier to position text and tables.

Parameters

<i>pdf</i>	Document handle
<i>page</i>	Page handle

Examples

[tut_ex01.c](#), [tut_ex02.c](#), [tut_ex02_1.c](#), [tut_ex03.c](#), [tut_ex04.c](#), [tut_ex05.c](#), [tut_ex06.c](#), [tut_ex07.c](#), [tut_ex08.c](#), [tut_ex09.c](#), [tut_ex10.c](#), [tut_ex11.c](#), [tut_ex12.c](#), [tut_ex13_1.c](#), [tut_ex13_2.c](#), [tut_ex14.c](#), and [tut_ex20.c](#).

15.7.5.54 hpdftbl_table_widget_letter_buttons()

```
void hpdftbl_table_widget_letter_buttons (
    HPDF_Doc doc,
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    HPDF_REAL width,
    HPDF_REAL height,
    const HPDF_RGBColor on_color,
    const HPDF_RGBColor off_color,
    const HPDF_RGBColor on_background,
    const HPDF_RGBColor off_background,
    const HPDF_REAL fsize,
    const char * letters,
    _Bool * state )
```

Display an array of letters as a table where each letter is its own "mini" cell and surrounded by a frame. Each boxed letter can be in an "on" state or "off" state which is illustrated with different font and face colors.

Parameters

<i>doc</i>	HPDF document handle
<i>page</i>	HPDF page handle
<i>xpos</i>	X-öosition of cell
<i>ypos</i>	Y-Position of cell
<i>width</i>	Width of cell
<i>height</i>	Height of cell
<i>on_color</i>	The font color in "on" state
<i>off_color</i>	The font color in "off" state
<i>on_background</i>	The face color in "on" state
<i>off_background</i>	The face color in "off" state
<i>fsize</i>	The font size
<i>letters</i>	What letters to have in the boxes
<i>state</i>	What state each boxed letter should be (0=off, 1=on)

Examples

[example01.c](#).

15.7.5.55 hpdftbl_use_header()

```
int hpdftbl_use_header (
    hpdftbl_t t,
    _Bool use )
```

Enable/disable the interpretation of the top row as a header row.

A header row will have a different style and labels will be disabled on this row. In addition the text will be centered vertically and horizontal in the cell.

Parameters

<i>t</i>	Table handle
<i>use</i>	TRUE to enable, FALSE to disable

Returns

0 on success, -1 on failure

See also

[hpdfctl_set_header_style\(\)](#)

Referenced by [hpdfctl_stroke_from_data\(\)](#).

15.7.5.56 hpdfctl_use_labelgrid()

```
int hpdfctl_use_labelgrid (  
    hpdfctl_t t,  
    _Bool use )
```

Shorter vertical line to mark labels.

Set the usage of special grid style where the vertical grid only covers the label text and a gap to the next line. Horizontal lines are drawn as usual. The label grid style gives the table a "lighter" look.

Parameters

<i>t</i>	Table handle
<i>use</i>	TRUE to use label grid, FALSE o disable it

Returns

0 on success, -1 on failure

See also

[hpdfctl_use_labels\(\)](#)

Referenced by [hpdfctl_stroke_from_data\(\)](#).

15.7.5.57 hpdftbl_use_labels()

```
int hpdftbl_use_labels (
    hpdftbl_t t,
    _Bool use )
```

@brief Enable/Disable the use of cell labels.

By default a newly created table will not use cell labels. Enabling labels will also by default enable the special label grid style. To adjust the grid style separately us the [hpdftbl_use_labelgrid\(\)](#) method.

Parameters

<i>t</i>	Table handle
<i>use</i>	Set to TRUE for cell labels

Returns

0 on success, -1 on failure

See also

[hpdfdbl_use_labelgrid\(\)](#)

Referenced by [hpdfdbl_stroke_from_data\(\)](#).

15.7.5.58 hpdfdbl_widget_hbar()

```
void hpdfdbl_widget_hbar (
    const HPDF_Doc doc,
    const HPDF_Page page,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
    const HPDF_REAL height,
    const HPDF_RGBColor color,
    const float val,
    const _Bool hide_val )
```

Draw a horizontal partially filled bar to indicate an analog (percentage) value.

This function can not be used directly as a canvas callback since it needs additional parameters. Instead create a simple canvas callback that gives the additional parameters.

Parameters

<i>doc</i>	HPDF Document handle
<i>page</i>	HPDF Page handle
<i>xpos</i>	Lower left x
<i>ypos</i>	Lower left y
<i>width</i>	Width of meter
<i>height</i>	Height of meter
<i>color</i>	Fill color for bar
<i>val</i>	Percentage fill in range [0.0, 100.0]
<i>hide_val</i>	TRUE to hide the value (in percent) at the right end of the entire bar

Examples

[example01.c](#).

15.7.5.59 hpdftbl_widget_segment_hbar()

```
void hpdftbl_widget_segment_hbar (
    const HPDF_Doc doc,
    const HPDF_Page page,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
    const HPDF_REAL height,
    const size_t num_segments,
    const HPDF_RGBColor on_color,
    const double val_percent,
    const _Bool hide_val )
```

Draw a horizontal segment meter that can be used to visualize a discrete value.

This function can not be used directly as a canvas callback since it needs additional parameters. Instead create a simple canvas callback that gives the additional parameters.

Parameters

<i>doc</i>	HPDF Document handle
<i>page</i>	HPDF Page handle
<i>xpos</i>	Lower left x
<i>ypos</i>	Lower left y
<i>width</i>	Width of meter
<i>height</i>	Height of meter
<i>num_segments</i>	Total number of segments
<i>on_color</i>	Color for "on" segment
<i>val_percent</i>	To what extent should the bars be filled (as a value 0.0 - 1.0)
<i>hide_val</i>	TRUE to hide the value (in percent) at the right end of the entire bar

Examples

[example01.c](#), and [tut_ex14.c](#).

15.7.5.60 hpdftbl_widget_slide_button()

```
void hpdftbl_widget_slide_button (
    HPDF_Doc doc,
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    HPDF_REAL width,
    HPDF_REAL height,
    _Bool state )
```

Table widget that draws a sliding on/off switch. Meant to be used in a canvas callback to display a boolean value.

This function can not be used directly as a canvas callback since it needs the state of the button as an argument. Instead create a simple canvas callback that determines the wanted state and then just passes on all argument to this widget function.

Parameters

<i>doc</i>	HPDF document handle
<i>page</i>	HPDF page handle
<i>xpos</i>	X-Position of cell
<i>ypos</i>	Y-Position of cell
<i>width</i>	Width of cell
<i>height</i>	Height of cell
<i>state</i>	State of button On/Off

Examples

[example01.c](#).

15.7.5.61 hpdftbl_widget_strength_meter()

```
void hpdftbl_widget_strength_meter (
    const HPDF_Doc doc,
    const HPDF_Page page,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
    const HPDF_REAL height,
    const size_t num_segments,
    const HPDF_RGBColor on_color,
    const size_t num_on_segments )
```

Draw a phone strength meter.

This function can not be used directly as a canvas callback since it needs additional parameters. Instead create a simple canvas callback that gives the additional parameters.

Parameters

<i>doc</i>	HPDF Document handle
<i>page</i>	HPDF Page handle
<i>xpos</i>	Lower left x
<i>ypos</i>	Lower left y
<i>width</i>	Width of meter
<i>height</i>	Height of meter
<i>num_segments</i>	Total number of segments
<i>on_color</i>	Color for "on" segment
<i>num_on_segments</i>	Number of on segments

Examples

[example01.c](#), and [tut_ex14.c](#).

15.9 /Users/ljp/Devel/hpdf_table/src/hpdftbl_errstr.c File Reference

Utility module to translate HPDF error codes to human readable strings.

```
#include <hpdf.h>
```

Data Structures

- struct [hpdftbl_errcode_entry](#)
An entry in the error string table.

Functions

- const char * [hpdftbl_hpdf_get_errstr](#) (const HPDF_STATUS err_code)
Function to return a human readable error string for an error code from Core HPDF library.

15.9.1 Detailed Description

Utility module to translate HPDF error codes to human readable strings.

15.9.2 Function Documentation

15.9.2.1 hpdftbl_hpdf_get_errstr()

```
const char * hpdftbl_hpdf_get_errstr (  
    const HPDF_STATUS err_code )
```

Function to return a human readable error string for an error code from Core HPDF library.

The various error codes given by the HPDF library can be translated back to a string by the usage of this function. The function will return a pointer to a static string that can not be manipulated.

Parameters

<code>err_code</code>	The error code
-----------------------	----------------

Returns

A pointer to an error string, NULL if the error code is invalid

See also

[hpdftbl_get_errstr\(\)](#)

15.10 /Users/ljp/Devel/hpdf_table/src/hpdftbl_grid.c File Reference

Create a grid on a document for positioning.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <hpdf.h>
```

Functions

- void [hpdftbl_stroke_grid](#) (HPDF_Doc pdf, HPDF_Page page)

15.10.1 Detailed Description

Create a grid on a document for positioning.

15.10.2 Function Documentation

15.10.2.1 hpdftbl_stroke_grid()

```
void hpdftbl_stroke_grid (
    HPDF_Doc pdf,
    HPDF_Page page )
```

Stroke a point grid on specified page to make it easier to position text and tables.

Parameters

<i>pdf</i>	Document handle
<i>page</i>	Page handle

15.11 /Users/ljp/Devel/hpdf_table/src/hpdftbl_theme.c File Reference

Functions for theme handling.

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <hpdf.h>
#include "hpdftbl.h"
```

Macros

- `#define HPDFTBL_DEFAULT_TITLE_STYLE (hpdf_text_style_t){HPDF_FF_HELVETICA_BOLD,11,(HPDF_↵_RGBColor){0,0,0},(HPDF_RGBColor){0.9f,0.9f,0.9f}, LEFT}`
Default style for table title.
- `#define HPDFTBL_DEFAULT_HEADER_STYLE (hpdf_text_style_t){HPDF_FF_HELVETICA_BOLD,10,(HPDF_↵_RGBColor){0,0,0},(HPDF_RGBColor){0.9f,0.9f,0.97f}, CENTER}`
Default style for table header row.
- `#define HPDFTBL_DEFAULT_LABEL_STYLE (hpdf_text_style_t){HPDF_FF_TIMES_ITALIC,9,(HPDF_↵_RGBColor){0.4f,0.4f,0.4f},(HPDF_RGBColor){1,1,1}, LEFT}`
Default style for table header row.
- `#define HPDFTBL_DEFAULT_CONTENT_STYLE (hpdf_text_style_t){HPDF_FF_COURIER,10,(HPDF_↵_RGBColor){0.2f,0.2f,0.2f},(HPDF_RGBColor){1,1,1}, LEFT}`
Default style for table header row.
- `#define HPDFTBL_DEFAULT_INNER_VGRID_STYLE (hpdftbl_grid_style_t){0.7, (HPDF_RGBColor){0.↵5f,0.5f,0.5f},0}`
Default style for table vertical inner grid.
- `#define HPDFTBL_DEFAULT_INNER_HGRID_STYLE (hpdftbl_grid_style_t){0.7, (HPDF_RGBColor){0.↵5f,0.5f,0.5f},0}`
Default style for table horizontal inner grid.
- `#define HPDFTBL_DEFAULT_OUTER_GRID_STYLE (hpdftbl_grid_style_t){1.0f, (HPDF_RGBColor){0.↵2f,0.2f,0.2f},0}`
Default style for table outer grid (border)
- `#define HPDFTBL_DEFAULT_ZEBRA1_COLOR (HPDF_RGBColor){1.0f,1.0f,1.0f}`
Default style for alternating row backgrounds color 1.
- `#define HPDFTBL_DEFAULT_ZEBRA2_COLOR (HPDF_RGBColor){0.95f,0.95f,0.95f}`
Default style for alternating row backgrounds color 2.

Functions

- `int hpdftbl_apply_theme (hpdftbl_t t, hpdftbl_theme_t *theme)`
Apply a specified theme to a table.
- `hpdftbl_theme_t * hpdftbl_get_default_theme (void)`
Return the default theme.
- `int hpdftbl_destroy_theme (hpdftbl_theme_t *theme)`
Destroy existing theme structure and free memory.

15.11.1 Detailed Description

Functions for theme handling.

15.11.2 Macro Definition Documentation

15.11.2.1 HPDFTBL_DEFAULT_CONTENT_STYLE

```
#define HPDFTBL_DEFAULT_CONTENT_STYLE (hpdf_text_style_t) {HPDF_FF_COURIER, 10, (HPDF_RGBColor) {0.↵  
2f, 0.2f, 0.2f}, (HPDF_RGBColor) {1, 1, 1}, LEFT}
```

Default style for table header row.

See also

[hpdftbl_set_content_style\(\)](#)

15.11.2.2 HPDFTBL_DEFAULT_HEADER_STYLE

```
#define HPDFTBL_DEFAULT_HEADER_STYLE (hpdf_text_style_t) {HPDF_FF_HELVETICA_BOLD, 10, (HPDF_↵  
RGBColor) {0, 0, 0}, (HPDF_RGBColor) {0.9f, 0.9f, 0.97f}, CENTER}
```

Default style for table header row.

See also

[hpdftbl_set_header_style\(\)](#)

15.11.2.3 HPDFTBL_DEFAULT_INNER_HGRID_STYLE

```
#define HPDFTBL_DEFAULT_INNER_HGRID_STYLE (hpdftbl_grid_style_t){0.7, (HPDF_RGBColor){0.↵  
5f,0.5f,0.5f},0}
```

Default style for table horizontal inner grid.

See also

[hpdftbl_set_inner_hgrid_style\(\)](#)

15.11.2.4 HPDFTBL_DEFAULT_INNER_VGRID_STYLE

```
#define HPDFTBL_DEFAULT_INNER_VGRID_STYLE (hpdftbl_grid_style_t){0.7, (HPDF_RGBColor){0.↵  
5f,0.5f,0.5f},0}
```

Default style for table vertical inner grid.

See also

[hpdftbl_set_inner_vgrid_style\(\)](#)

15.11.2.5 HPDFTBL_DEFAULT_LABEL_STYLE

```
#define HPDFTBL_DEFAULT_LABEL_STYLE (hpdf_text_style_t){HPDF_FF_TIMES_ITALIC,9,(HPDF_RGBColor){0.↵  
4f,0.4f,0.4f},(HPDF_RGBColor){1,1,1}, LEFT}
```

Default style for table header row.

See also

[hpdftbl_set_label_style\(\)](#)

15.11.2.6 HPDFTBL_DEFAULT_OUTER_GRID_STYLE

```
#define HPDFTBL_DEFAULT_OUTER_GRID_STYLE (hpdftbl_grid_style_t){1.0f, (HPDF_RGBColor){0.↵  
2f,0.2f,0.2f},0}
```

Default style for table outer grid (border)

See also

[hpdftbl_set_outer_grid_style\(\)](#)

15.11.2.7 HPDFTBL_DEFAULT_ZEBRA1_COLOR

```
#define HPDFTBL_DEFAULT_ZEBRA1_COLOR (HPDF_RGBColor){1.0f,1.0f,1.0f}
```

Default style for alternating row backgrounds color 1.

Todo Implement zebra table coloring

15.11.2.8 HPDFTBL_DEFAULT_ZEBRA2_COLOR

```
#define HPDFTBL_DEFAULT_ZEBRA2_COLOR (HPDF_RGBColor){0.95f,0.95f,0.95f}
```

Default style for alternating row backgrounds color 2.

Todo Implement zebra table coloring

15.11.3 Function Documentation

15.11.3.1 hpdfctl_apply_theme()

```
int hpdfctl_apply_theme (  
    hpdfctl_t t,  
    hpdfctl_theme_t * theme )
```

Apply a specified theme to a table.

The default table theme can be retrieved with [hpdfctl_get_default_theme\(\)](#)

Parameters

<i>t</i>	Table handle
<i>theme</i>	Theme reference

Returns

0 on success, -1 on failure

See also

[hpdfctl_get_default_theme\(\)](#)

Referenced by [hpdfctl_create_title\(\)](#), and [hpdfctl_stroke_from_data\(\)](#).

15.11.3.2 hpdftbl_destroy_theme()

```
int hpdftbl_destroy_theme (
    hpdftbl_theme_t * theme )
```

Destroy existing theme structure and free memory.

Free all memory allocated by a theme

Parameters

<i>theme</i>	The theme to free
--------------	-------------------

Returns

-1 for error , 0 for success

Referenced by [hpdftbl_create_title\(\)](#).

15.11.3.3 hpdftbl_get_default_theme()

```
hpdftbl_theme_t * hpdftbl_get_default_theme (
    void )
```

Return the default theme.

Create and return a theme corresponding to the default table theme. It is the calling functions responsibility to call [hpdftbl_destroy_theme\(\)](#) to free the allocated memory. The default theme is a good starting point to just make minor modifications without having to define all elements.

Returns

A new theme initialized to the default settings

See also

[hpdftbl_apply_theme\(\)](#)

Referenced by [hpdftbl_create_title\(\)](#).

15.12 /Users/ljp/Devel/hpdf_table/src/hpdftbl_widget.c File Reference

Support for drawing widgets.

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <hpdf.h>
#include <string.h>
#include <math.h>
#include "hpdftbl.h"
```

Macros

- `#define TRUE 1`
- `#define FALSE 0`

Functions

- void `hpdftbl_table_widget_letter_buttons` (HPDF_Doc doc, HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, const HPDF_RGBColor on_color, const HPDF_RGBColor off_color, const HPDF_RGBColor on_background, const HPDF_RGBColor off_background, const HPDF_REAL fsize, const char *letters, _Bool *state)
Display an array of letters as a table where each letter is its own "mini" cell and surrounded by a frame. Each boxed letter can be in an "on" state or "off" state which is illustrated with different font and fac colors.
- void `hpdftbl_widget_slide_button` (HPDF_Doc doc, HPDF_Page page, HPDF_REAL xpos, HPDF_REAL ypos, HPDF_REAL width, HPDF_REAL height, _Bool state)
Table widget that draws a sliding on/off switch. Meant to be used in a canvas callback to display a boolean value.
- void `hpdftbl_widget_hbar` (const HPDF_Doc doc, const HPDF_Page page, const HPDF_REAL xpos, const HPDF_REAL ypos, const HPDF_REAL width, const HPDF_REAL height, const HPDF_RGBColor color, const float val, const _Bool hide_val)
Draw a horizontal partially filled bar to indicate an analog (percentage) value.
- void `hpdftbl_widget_segment_hbar` (const HPDF_Doc doc, const HPDF_Page page, const HPDF_REAL xpos, const HPDF_REAL ypos, const HPDF_REAL width, const HPDF_REAL height, const size_t num_segments, const HPDF_RGBColor on_color, const double val_percent, const _Bool hide_val)
Draw a horizontal segment meter that can be used to visualize a discrete value.
- void `hpdftbl_widget_strength_meter` (const HPDF_Doc doc, const HPDF_Page page, const HPDF_REAL xpos, const HPDF_REAL ypos, const HPDF_REAL width, const HPDF_REAL height, const size_t num_segments, const HPDF_RGBColor on_color, const size_t num_on_segments)
Draw a phone strength meter.

15.12.1 Detailed Description

Support for drawing widgets.

15.12.2 Macro Definition Documentation

15.12.2.1 FALSE

```
#define FALSE 0
```

C Boolean false value

15.12.2.2 TRUE

```
#define TRUE 1
```

C Boolean truth value

15.12.3 Function Documentation

15.12.3.1 hpdftbl_table_widget_letter_buttons()

```
void hpdftbl_table_widget_letter_buttons (
    HPDF_Doc doc,
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    HPDF_REAL width,
    HPDF_REAL height,
    const HPDF_RGBColor on_color,
    const HPDF_RGBColor off_color,
    const HPDF_RGBColor on_background,
    const HPDF_RGBColor off_background,
    const HPDF_REAL fsize,
    const char * letters,
    _Bool * state )
```

Display an array of letters as a table where each letter is its own "mini" cell and surrounded by a frame. Each boxed letter can be in an "on" state or "off" state which is illustrated with different font and face colors.

Parameters

<i>doc</i>	HPDF document handle
<i>page</i>	HPDF page handle
<i>xpos</i>	X-öosition of cell
<i>ypos</i>	Y-Position of cell
<i>width</i>	Width of cell
<i>height</i>	Height of cell
<i>on_color</i>	The font color in "on" state
<i>off_color</i>	The font color in "off" state
<i>on_background</i>	The face color in "on" state
<i>off_background</i>	The face color in "off" state
<i>fsize</i>	The font size
<i>letters</i>	What letters to have in the boxes
<i>state</i>	What state each boxed letter should be (0=off, 1=on)

15.12.3.2 hpdftbl_widget_hbar()

```
void hpdftbl_widget_hbar (
    const HPDF_Doc doc,
    const HPDF_Page page,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
```

```

const HPDF_REAL height,
const HPDF_RGBColor color,
const float val,
const _Bool hide_val )

```

Draw a horizontal partially filled bar to indicate an analog (percentage) value.

This function can not be used directly as a canvas callback since it needs additional parameters. Instead create a simple canvas callback that gives the additional parameters.

Parameters

<i>doc</i>	HPDF Document handle
<i>page</i>	HPDF Page handle
<i>xpos</i>	Lower left x
<i>ypos</i>	Lower left y
<i>width</i>	Width of meter
<i>height</i>	Height of meter
<i>color</i>	Fill color for bar
<i>val</i>	Percentage fill in range [0.0, 100.0]
<i>hide_val</i>	TRUE to hide the value (in percent) at the right end of the entire bar

15.12.3.3 `hpdf_tbl_widget_segment_hbar()`

```

void hpdf_tbl_widget_segment_hbar (
    const HPDF_Doc doc,
    const HPDF_Page page,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
    const HPDF_REAL height,
    const size_t num_segments,
    const HPDF_RGBColor on_color,
    const double val_percent,
    const _Bool hide_val )

```

Draw a horizontal segment meter that can be used to visualize a discrete value.

This function can not be used directly as a canvas callback since it needs additional parameters. Instead create a simple canvas callback that gives the additional parameters.

Parameters

<i>doc</i>	HPDF Document handle
<i>page</i>	HPDF Page handle
<i>xpos</i>	Lower left x
<i>ypos</i>	Lower left y
<i>width</i>	Width of meter
<i>height</i>	Height of meter
<i>num_segments</i>	Total number of segments
<i>on_color</i>	Color for "on" segment
<i>val_percent</i>	To what extent should the bars be filled (as a value 0.0 - 1.0)
<i>hide_val</i>	TRUE to hide the value (in percent) at the right end of the entire bar

15.12.3.4 hpdftbl_widget_slide_button()

```
void hpdftbl_widget_slide_button (
    HPDF_Doc doc,
    HPDF_Page page,
    HPDF_REAL xpos,
    HPDF_REAL ypos,
    HPDF_REAL width,
    HPDF_REAL height,
    _Bool state )
```

Table widget that draws a sliding on/off switch. Meant to be used in a canvas callback to display a boolean value.

This function can not be used directly as a canvas callback since it needs the state of the button as an argument. Instead create a simple canvas callback that determines the wanted state and then just passes on all argument to this widget function.

Parameters

<i>doc</i>	HPDF document handle
<i>page</i>	HPDF page handle
<i>xpos</i>	X-Position of cell
<i>ypos</i>	Y-Position of cell
<i>width</i>	Width of cell
<i>height</i>	Height of cell
<i>state</i>	State of button On/Off

15.12.3.5 hpdftbl_widget_strength_meter()

```
void hpdftbl_widget_strength_meter (
    const HPDF_Doc doc,
    const HPDF_Page page,
    const HPDF_REAL xpos,
    const HPDF_REAL ypos,
    const HPDF_REAL width,
    const HPDF_REAL height,
    const size_t num_segments,
    const HPDF_RGBColor on_color,
    const size_t num_on_segments )
```

Draw a phone strength meter.

This function can not be used directly as a canvas callback since it needs additional parameters. Instead create a simple canvas callback that gives the additional parameters.

Parameters

<i>doc</i>	HPDF Document handle
------------	----------------------

Parameters

<i>page</i>	HPDF Page handle
<i>xpos</i>	Lower left x
<i>ypos</i>	Lower left y
<i>width</i>	Width of meter
<i>height</i>	Height of meter
<i>num_segments</i>	Total number of segments
<i>on_color</i>	Color for "on" segment
<i>num_on_segments</i>	Number of on segments

Chapter 16

Example Documentation

16.1 example01.c

A collection of more and less advanced examples in one file. For learning the library it is better to start with the organized tutorial examples like [tut_ex01.c](#) and [tut_ex02.c](#)

```
/*
 * Example on how to use the hpdfctl module to facilitate the creation of
 * structured tables with Haru PF library.
 *
 * So on OSX Compile this with:
 *
 * gcc --std=c99 -lm -lhpdf -liconv example01.c
 *
 * However, it is usually a good idea to enable as many compiler warnings as
 * possible so the recommended way to compile is:
 *
 * gcc --std=c99 -Wall -Wpedantic -Wextra -Wpointer-arith -lm -lhpdf -liconv example01.c
 *
 * Adjust as needed for other environments
 */
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#if !(defined __WIN32 || defined __WIN32__)
#include <unistd.h>
